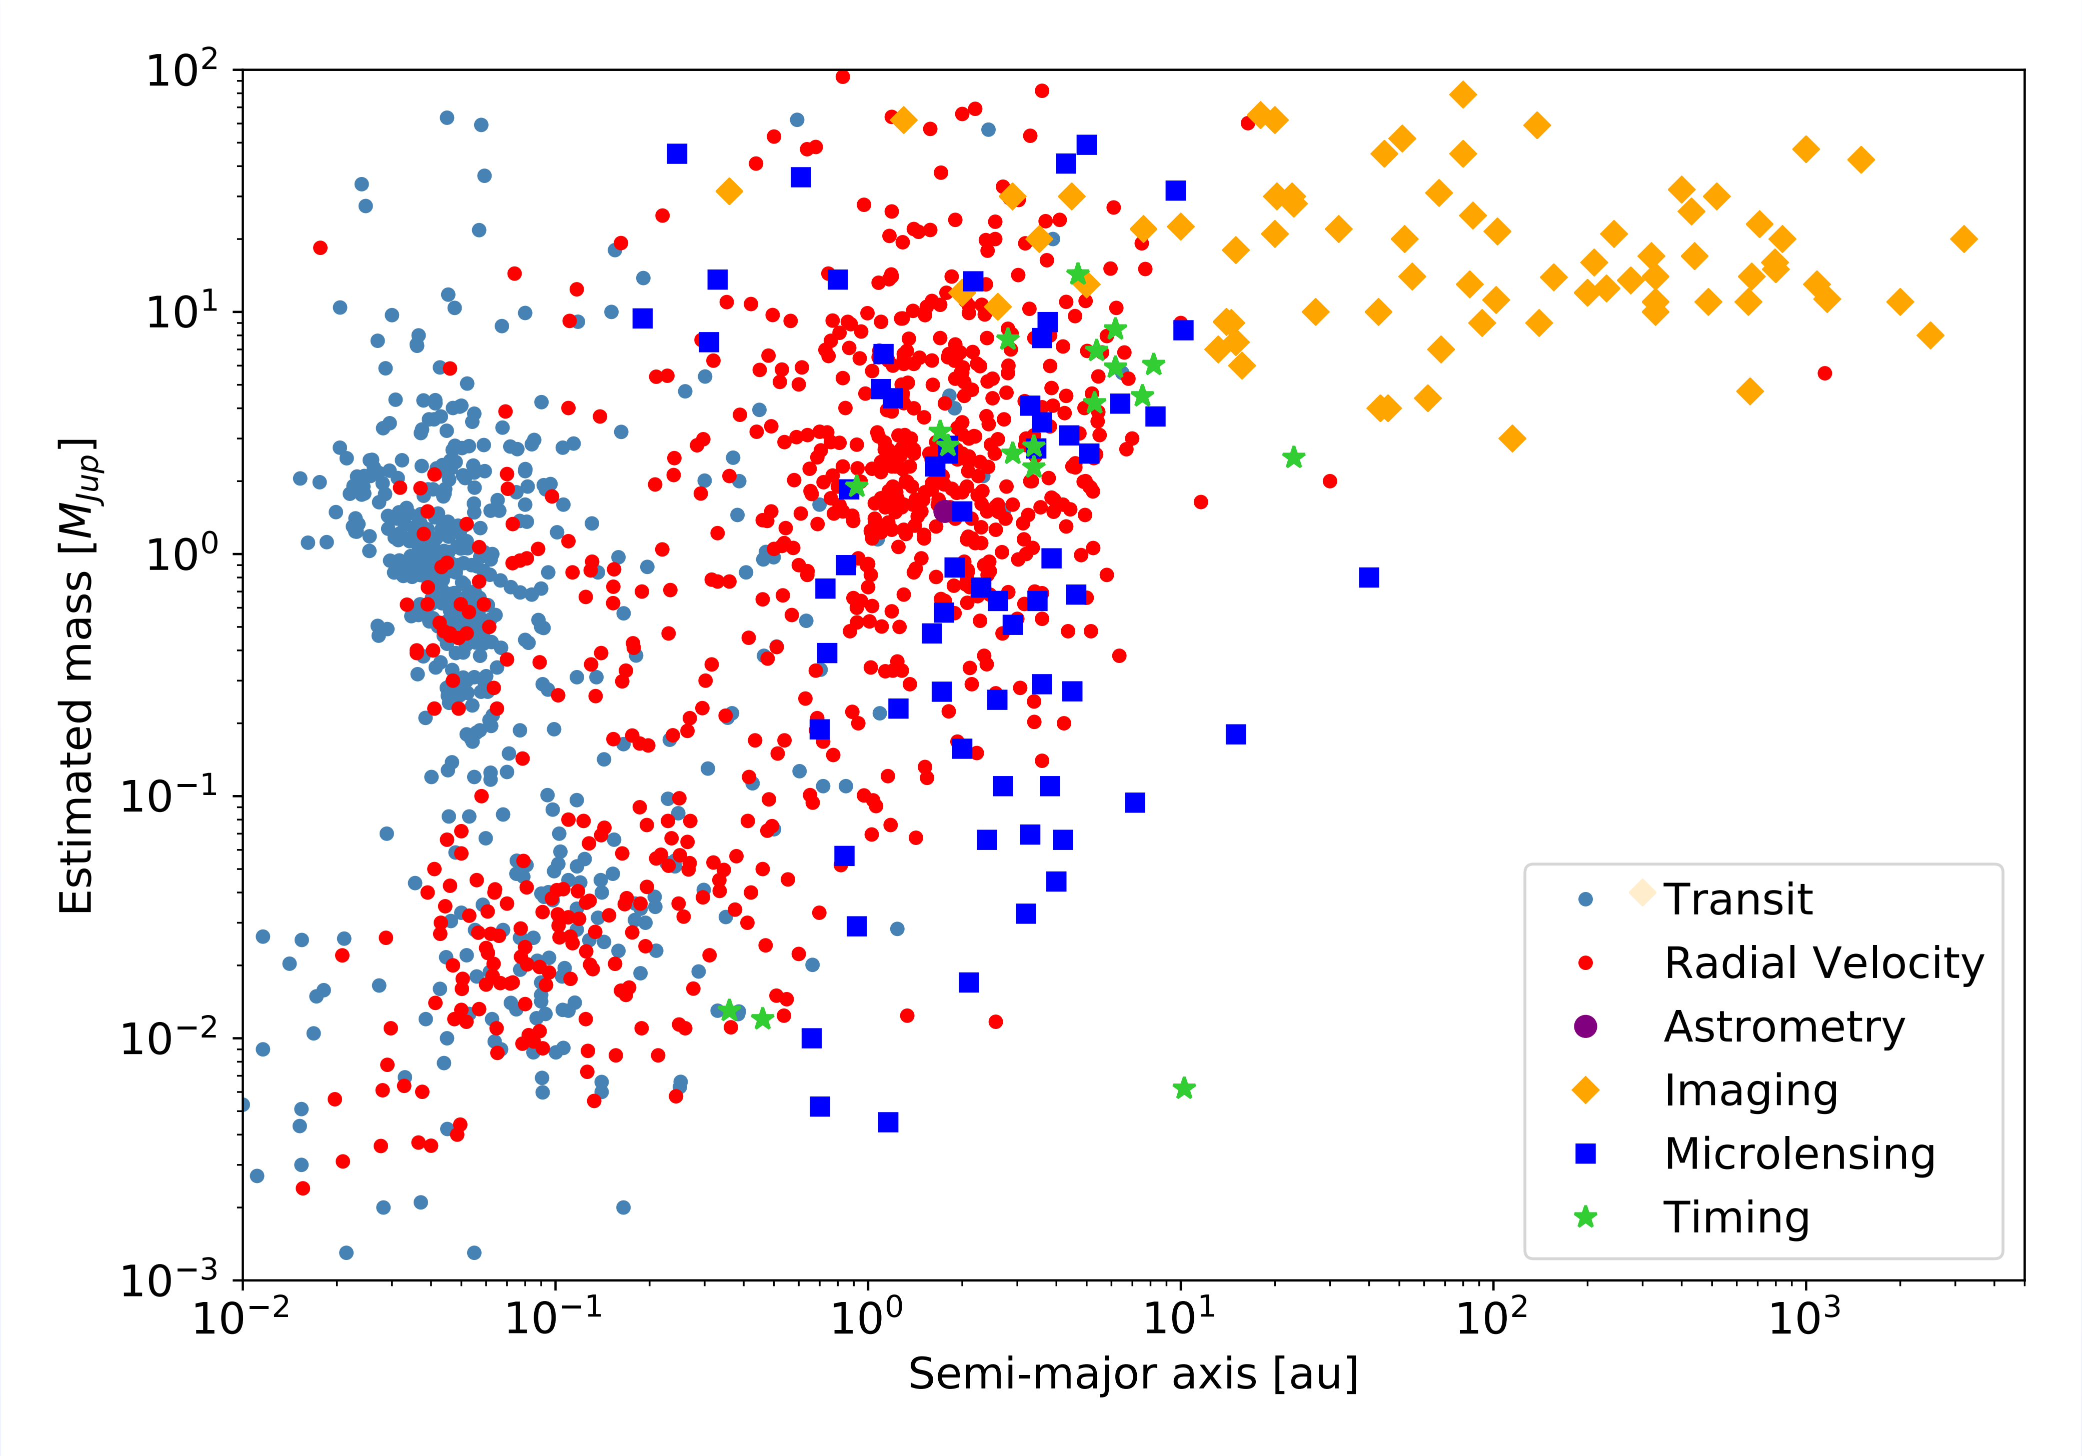
HiRISE
Detection and characterisation of young giant exoplanets at high-spectral resolution

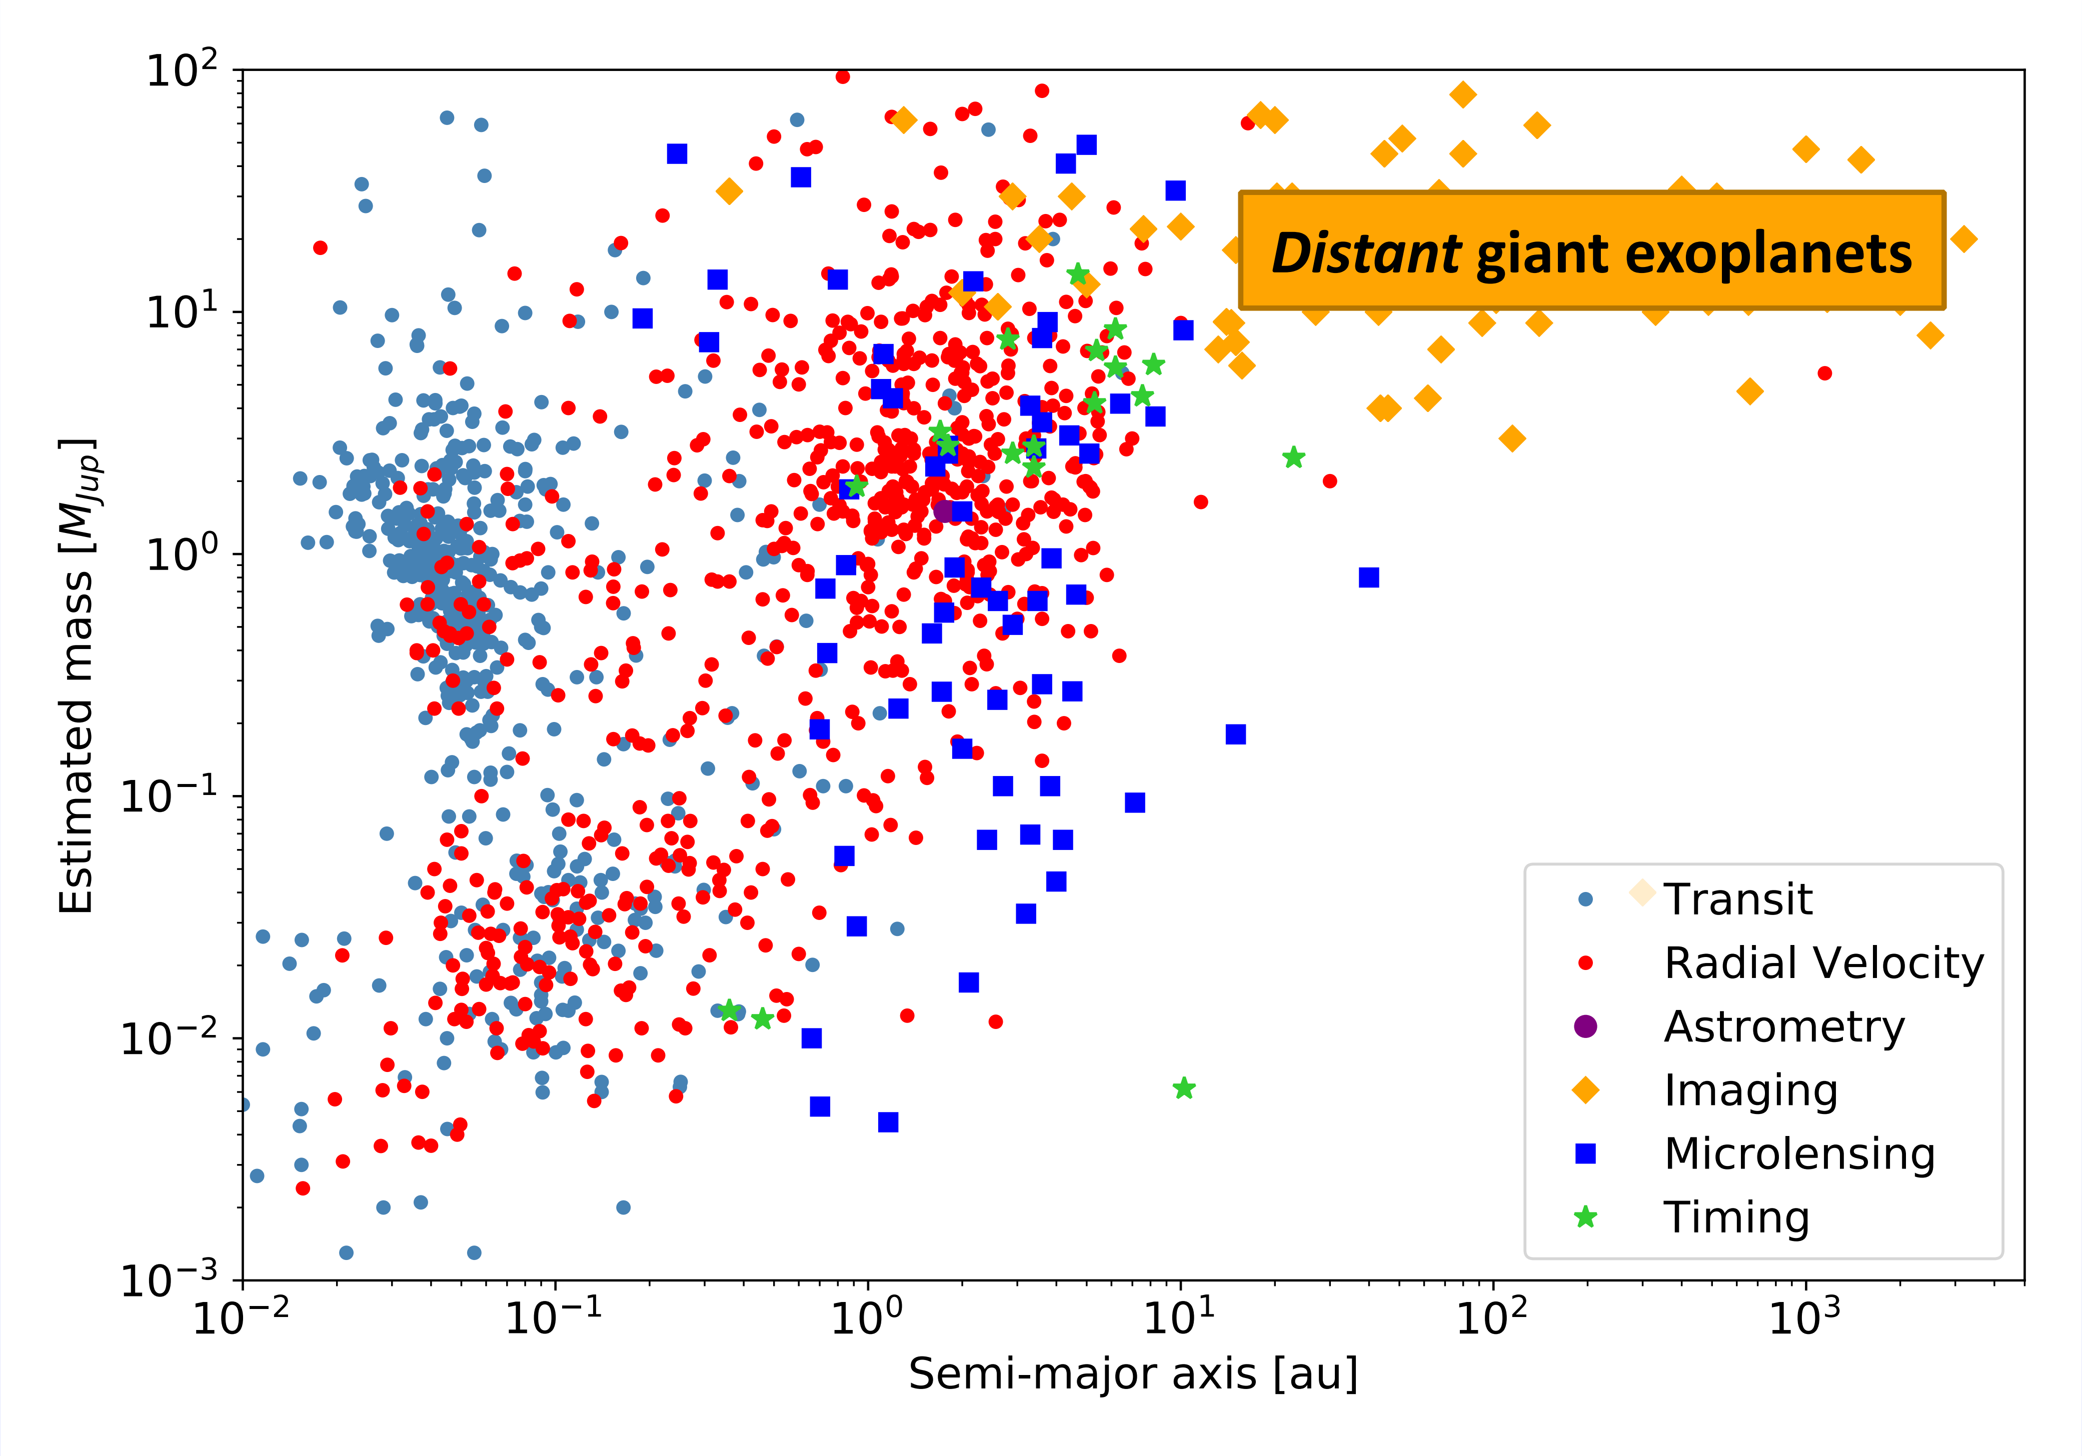
Arthur Vigan
Groupe Sciences Planétaires (GSP)
Groupe R&D en instrumentation (GRD)

Context

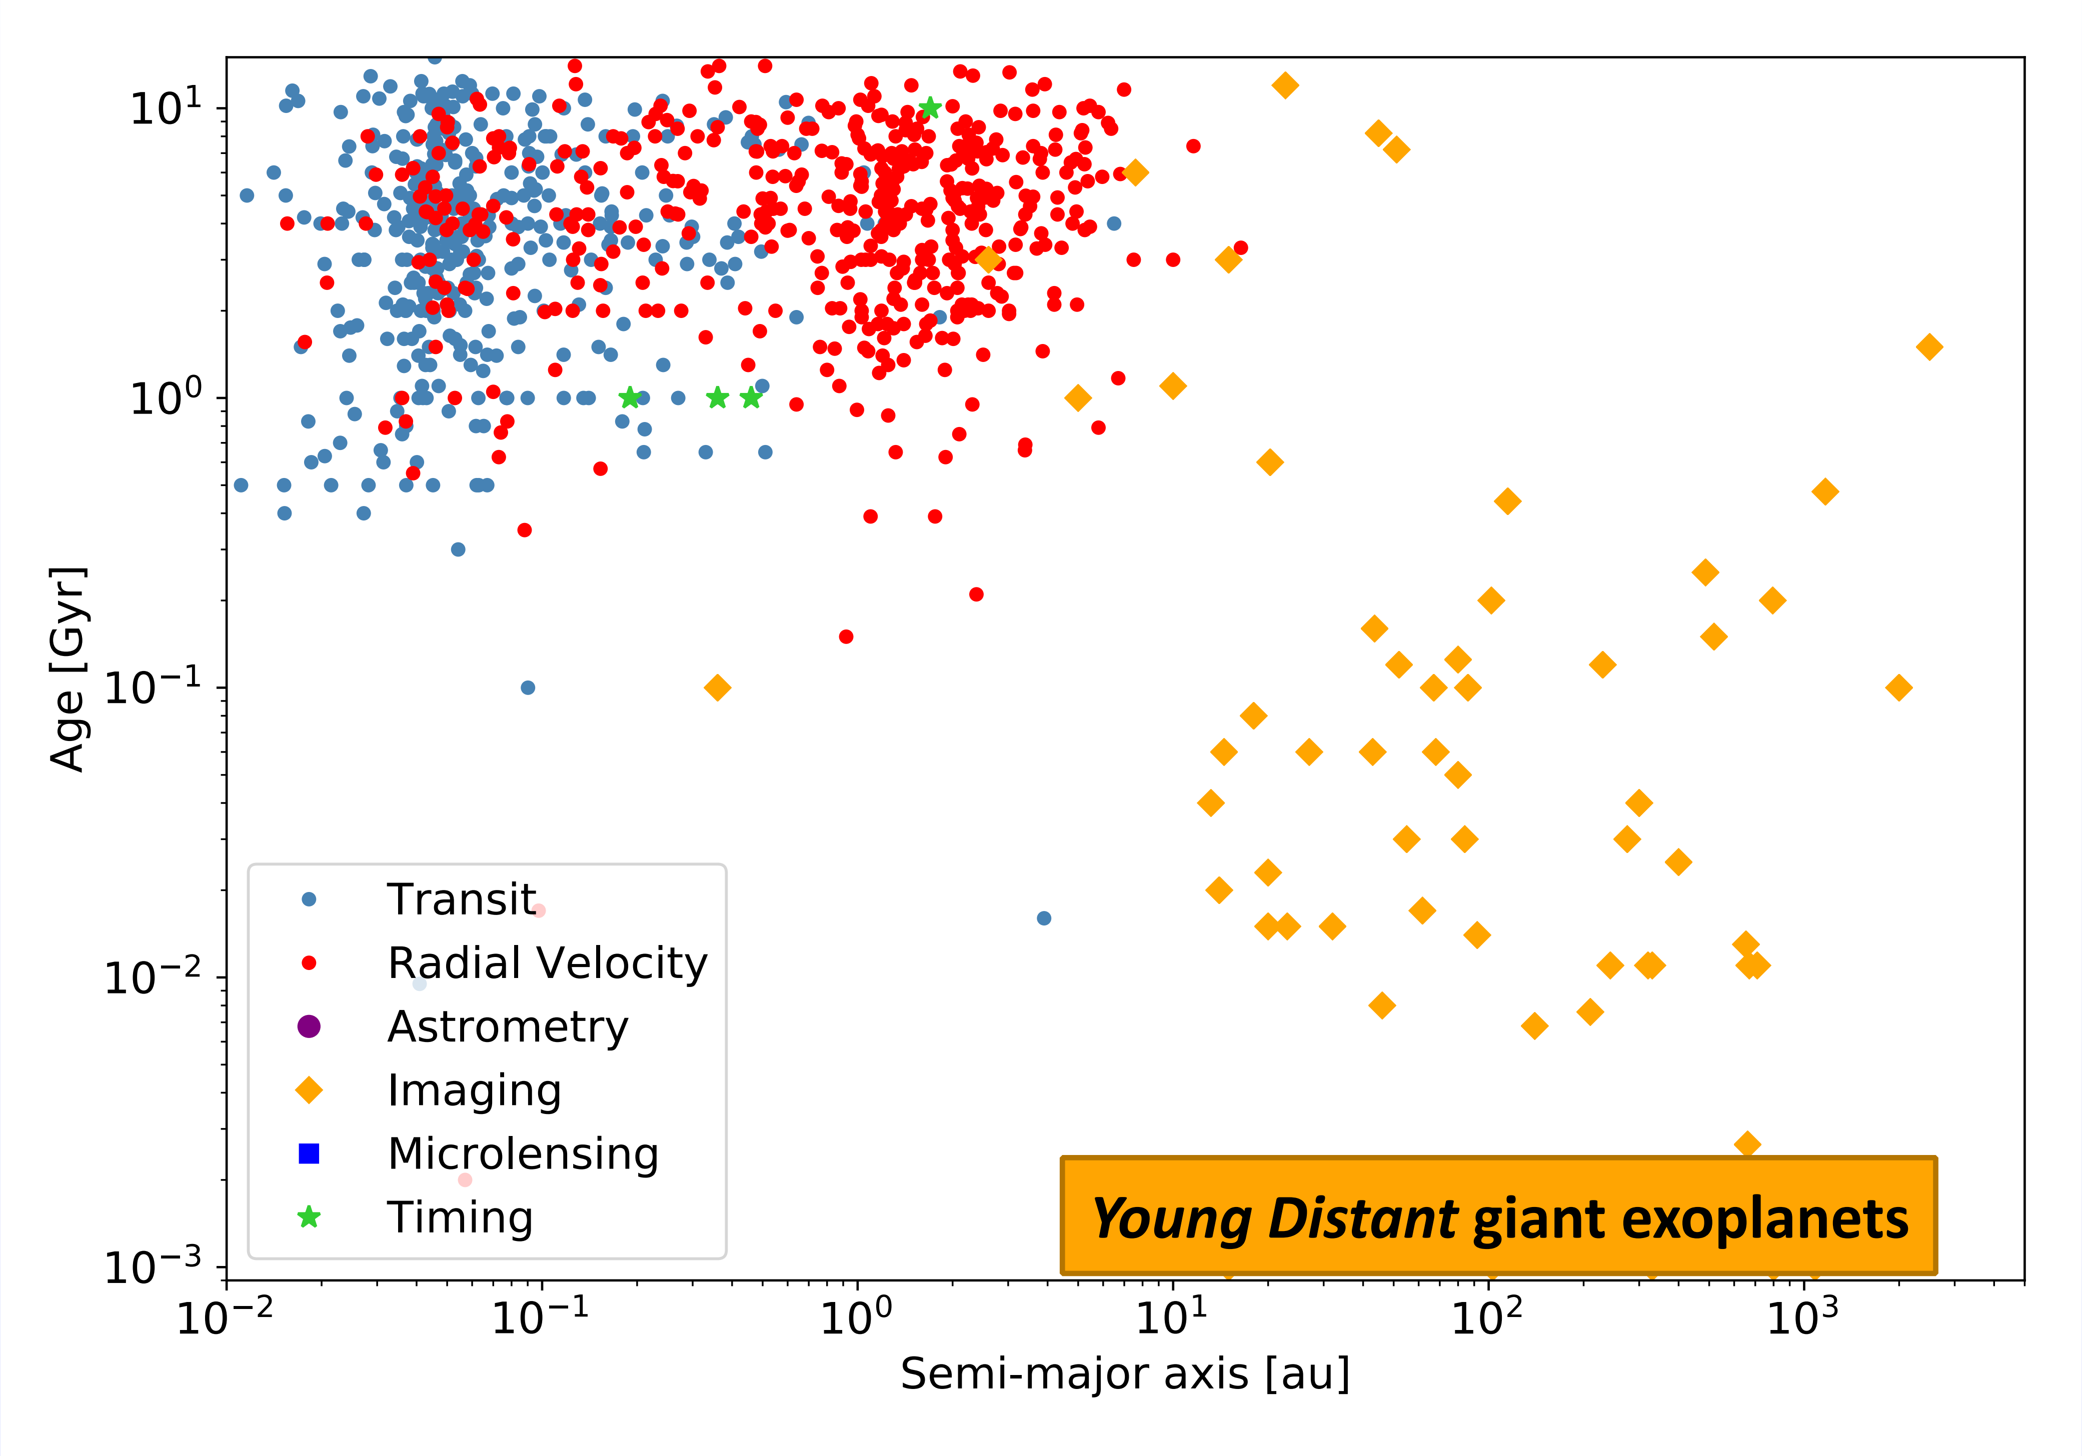
Imaging of low-mass companions



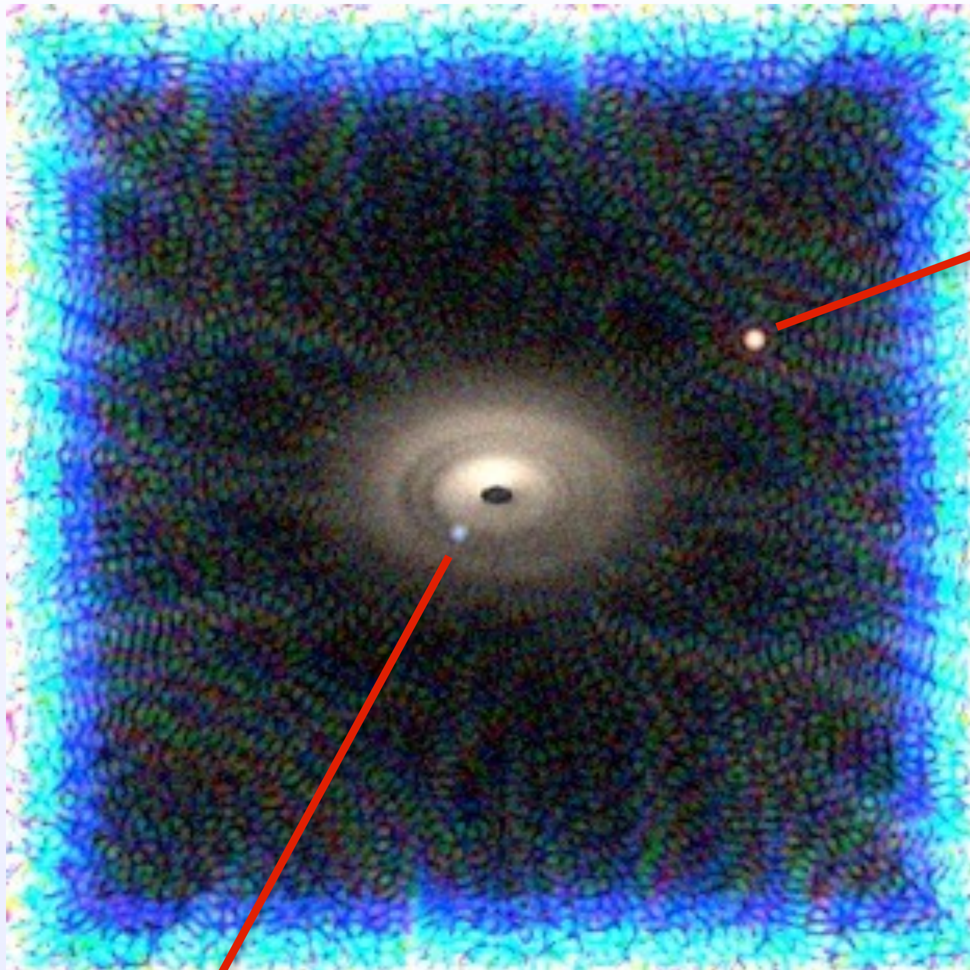
Imaging of low-mass companions

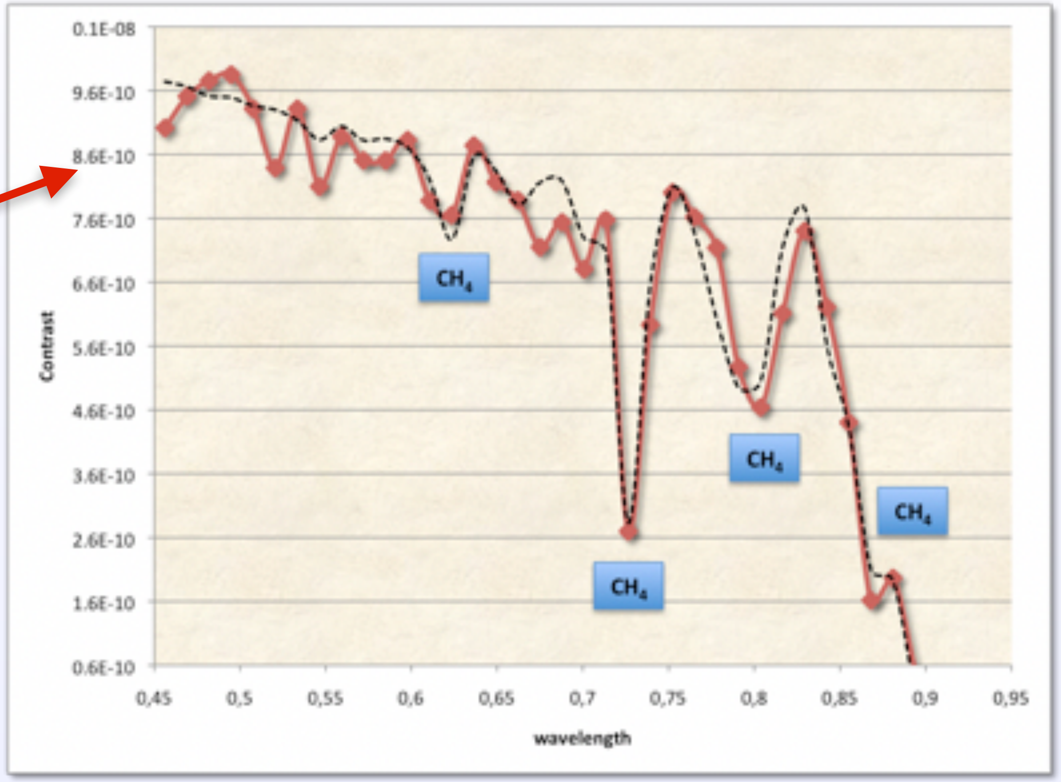


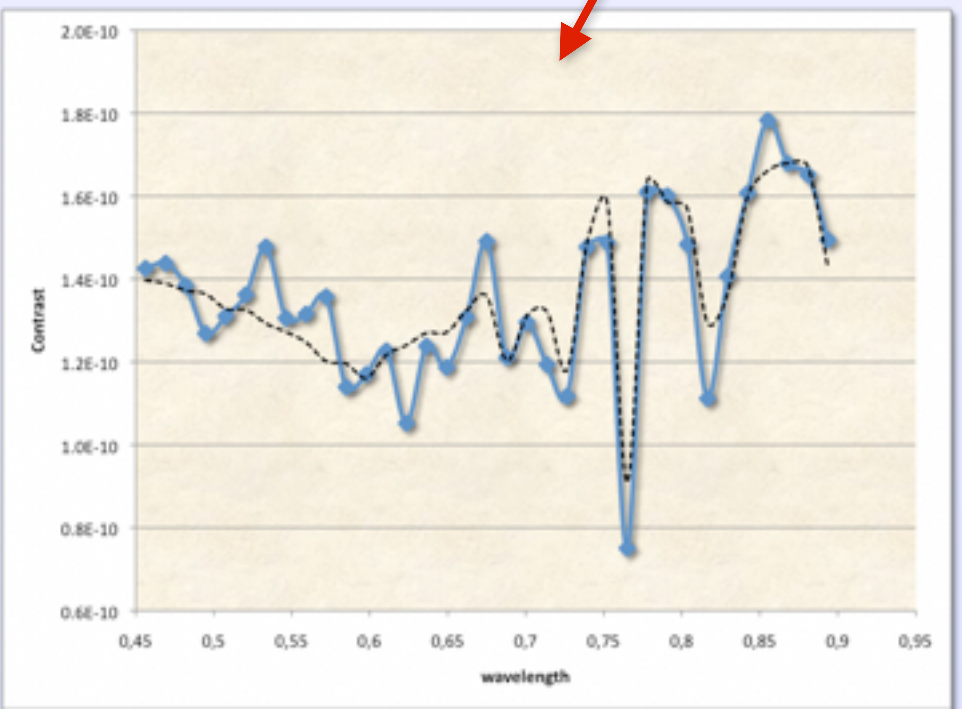
Imaging of low-mass companions



Why do imaging?

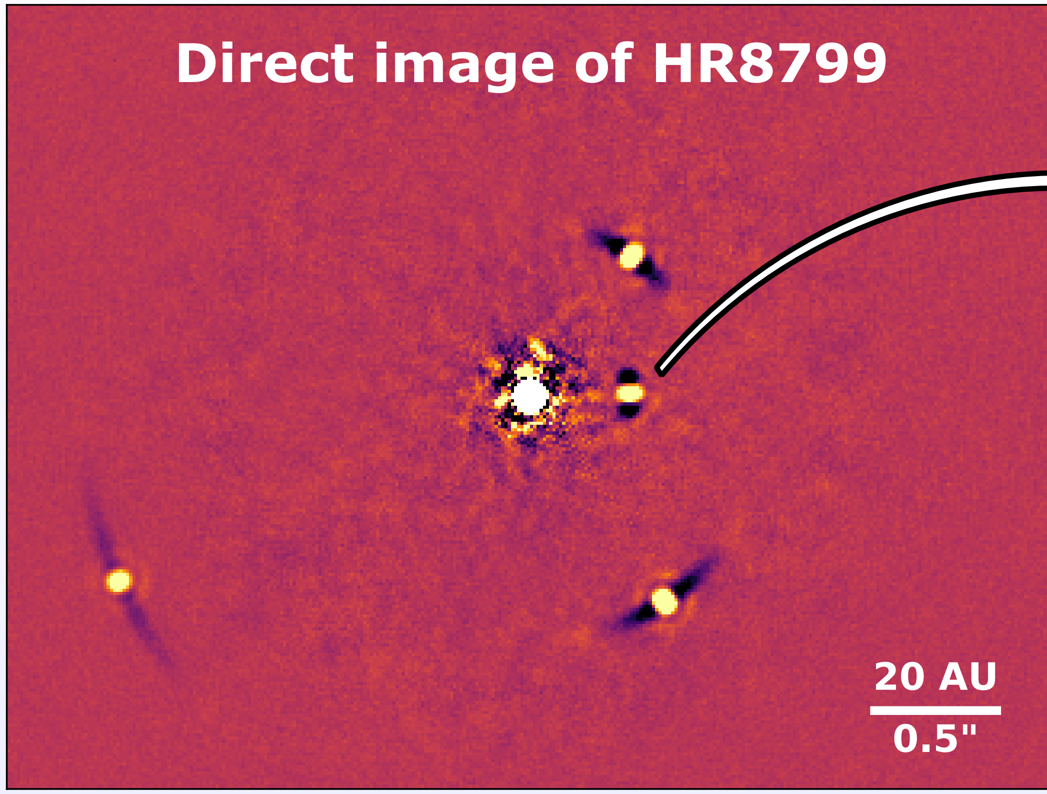






- complementary with other methods:
  - mass, semi-major axis & age
- sensitive to all spatial components: planets, disk
- direct access to:
  - architecture of systems
  - flux vs. wavelength (total and/or polarised)

Atmospheric composition of exoplanets



Zurlo, **Vigan** et al. (2016)

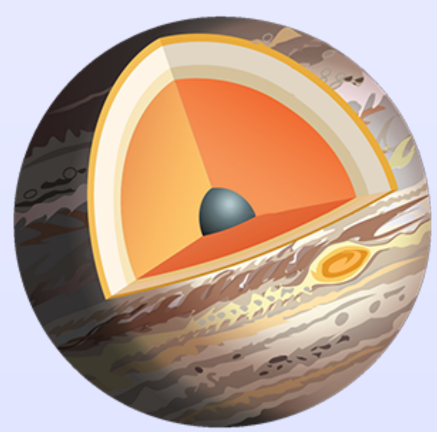
Giant exoplanets shape planetary systems

Giant:	> 1 M_{Jup}
Distant:	> 5 AU
Cold:	< 1500K

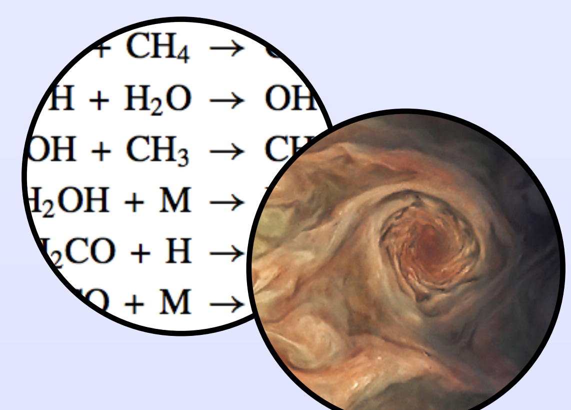
Outstanding questions to be answered with direct imaging

Formation & migration

Internal structure

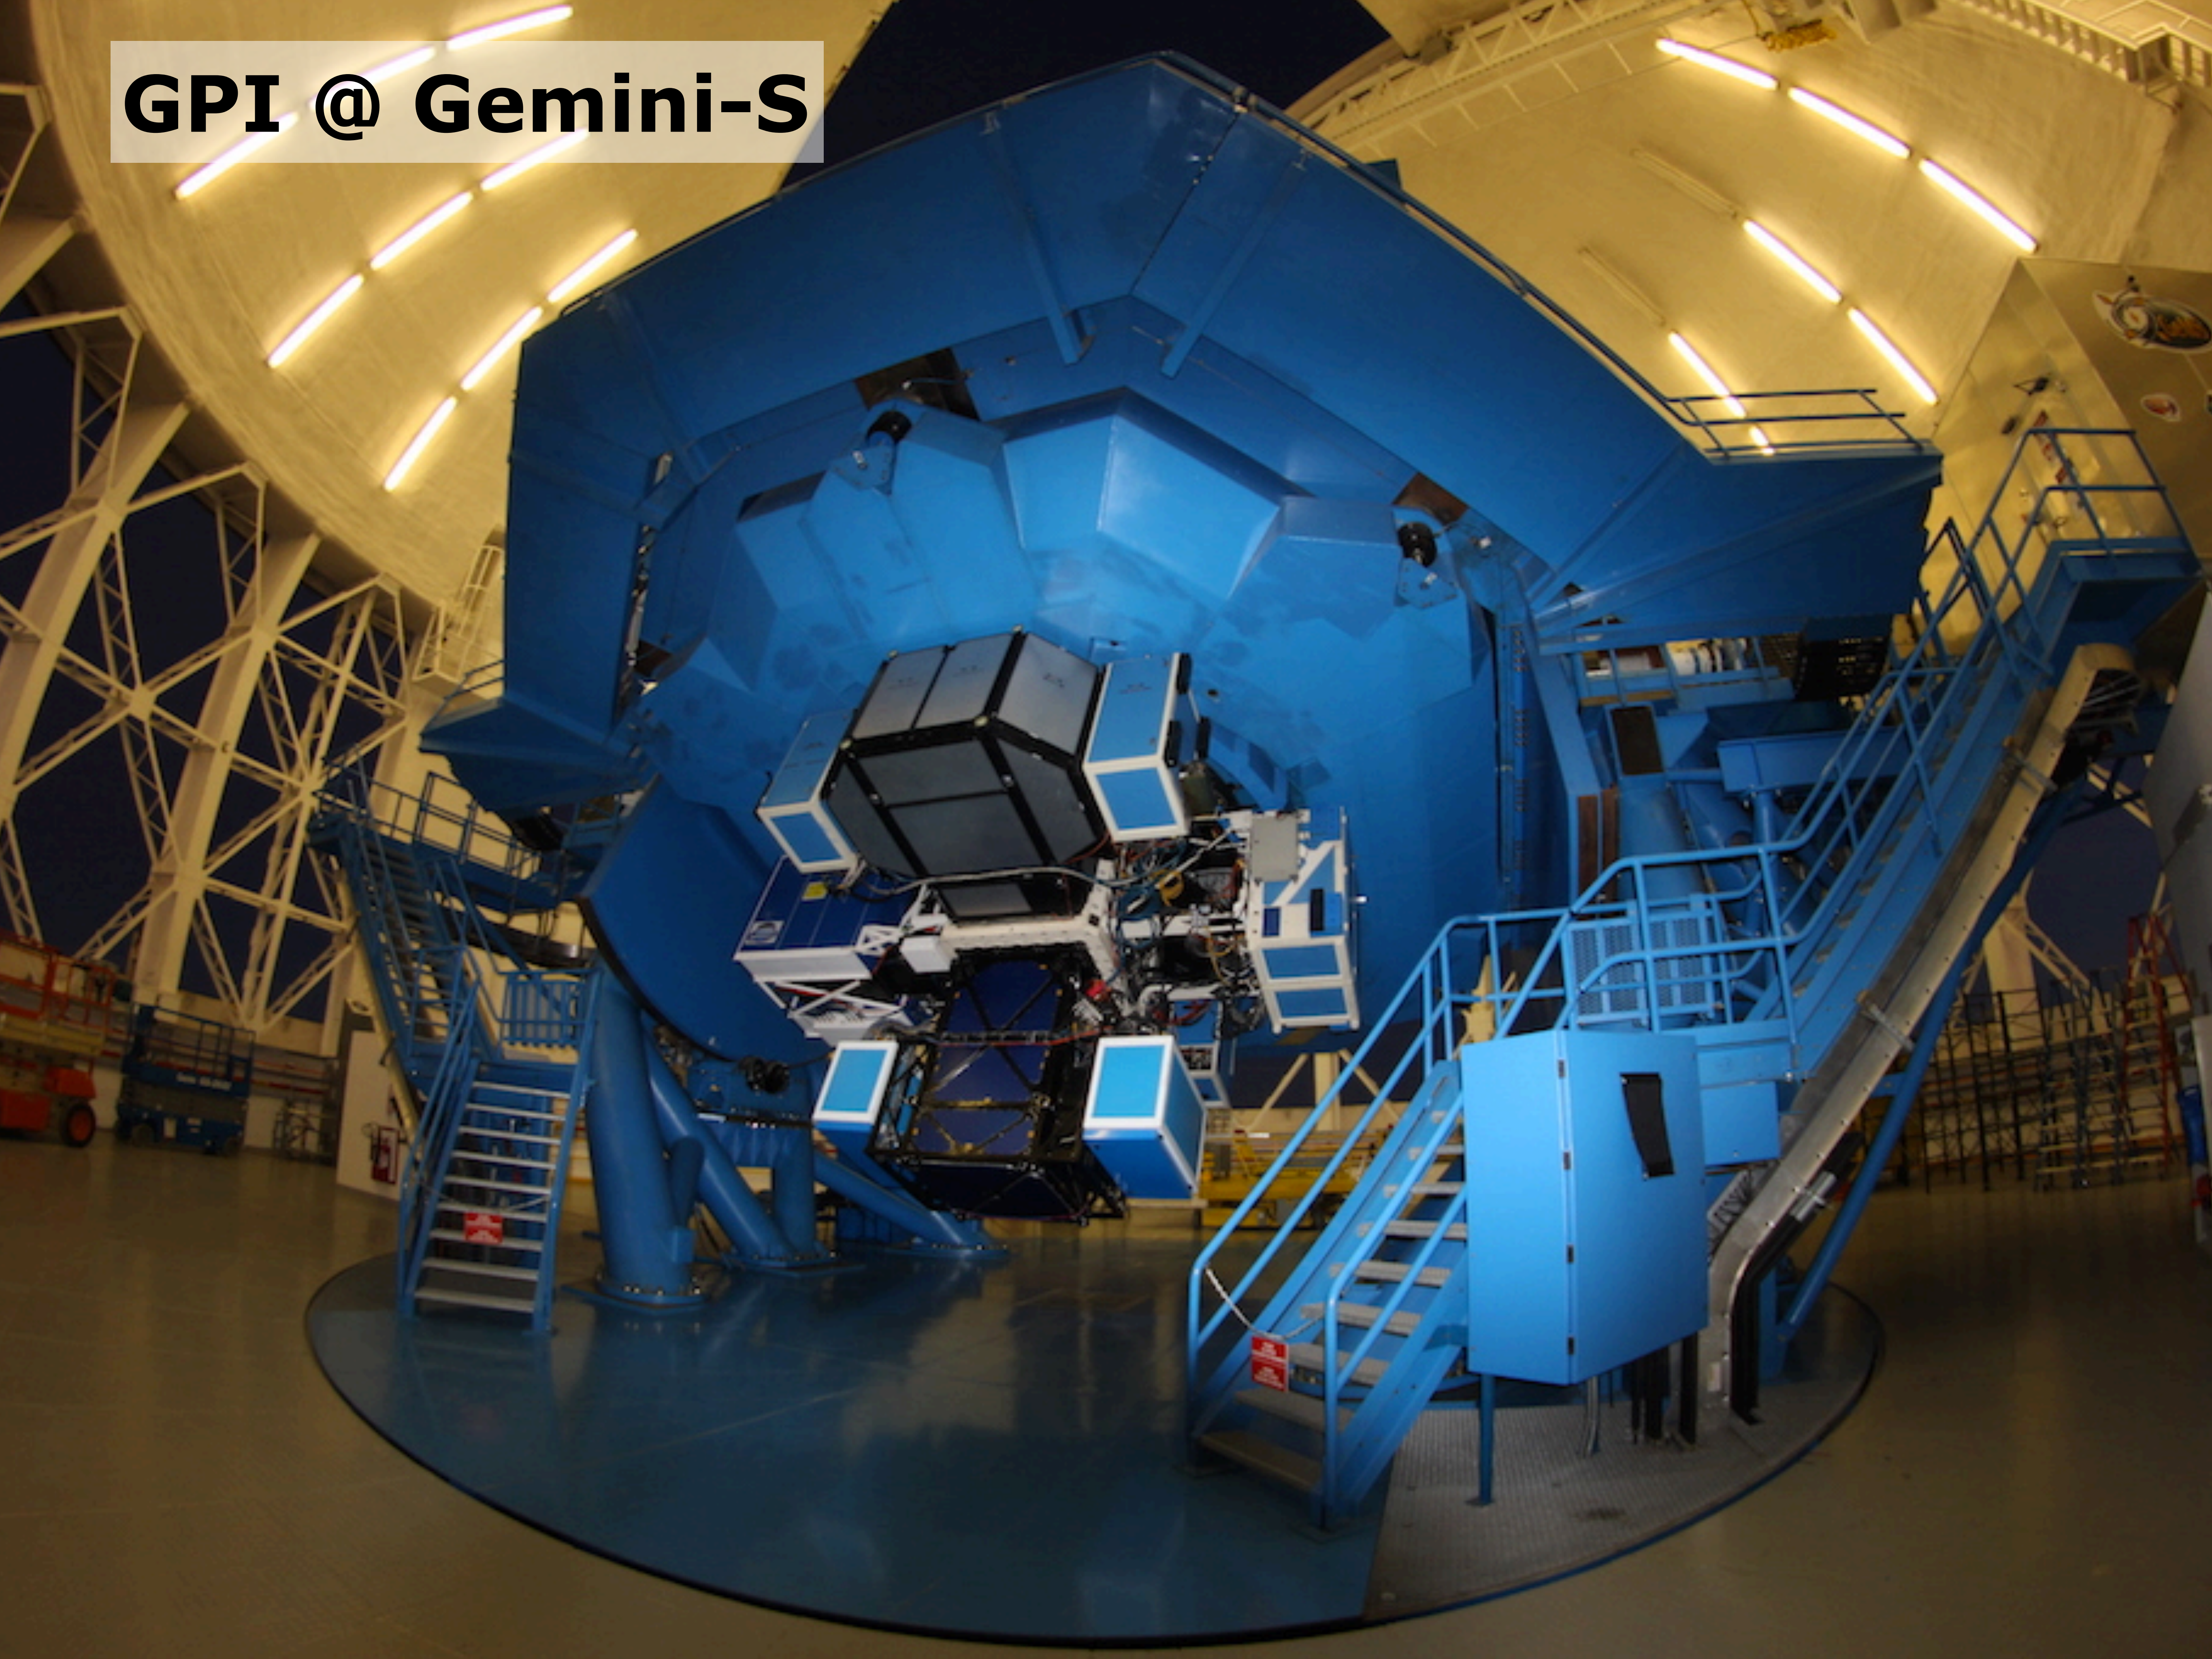


Atmosphere chemistry & dynamics



Today's high-contrast imagers

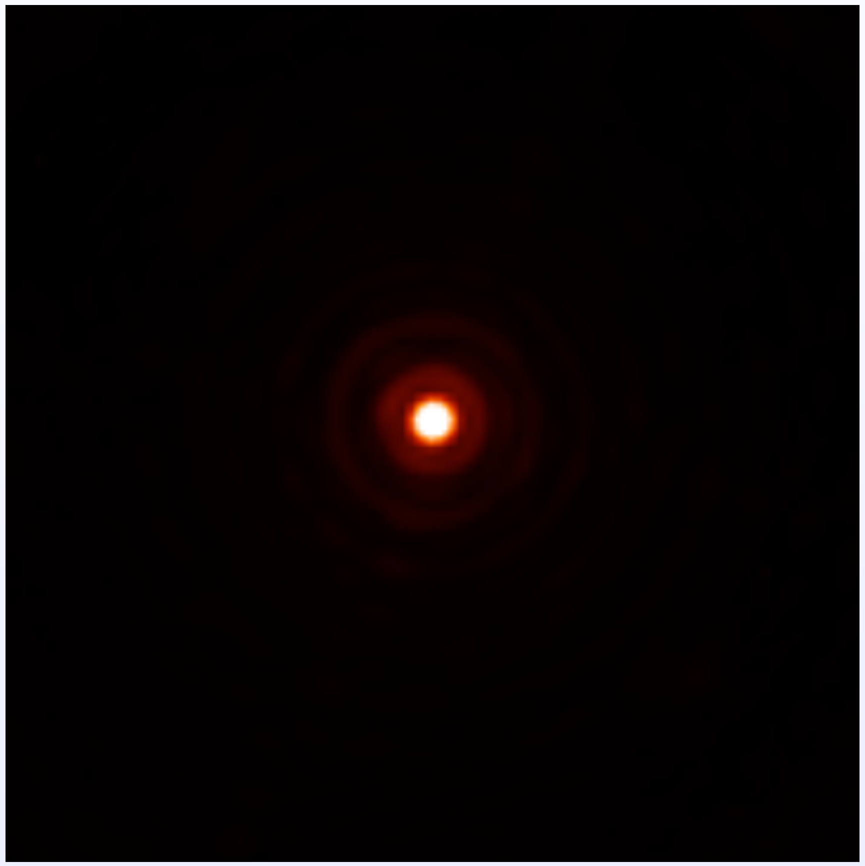
SPHERE @ VLT



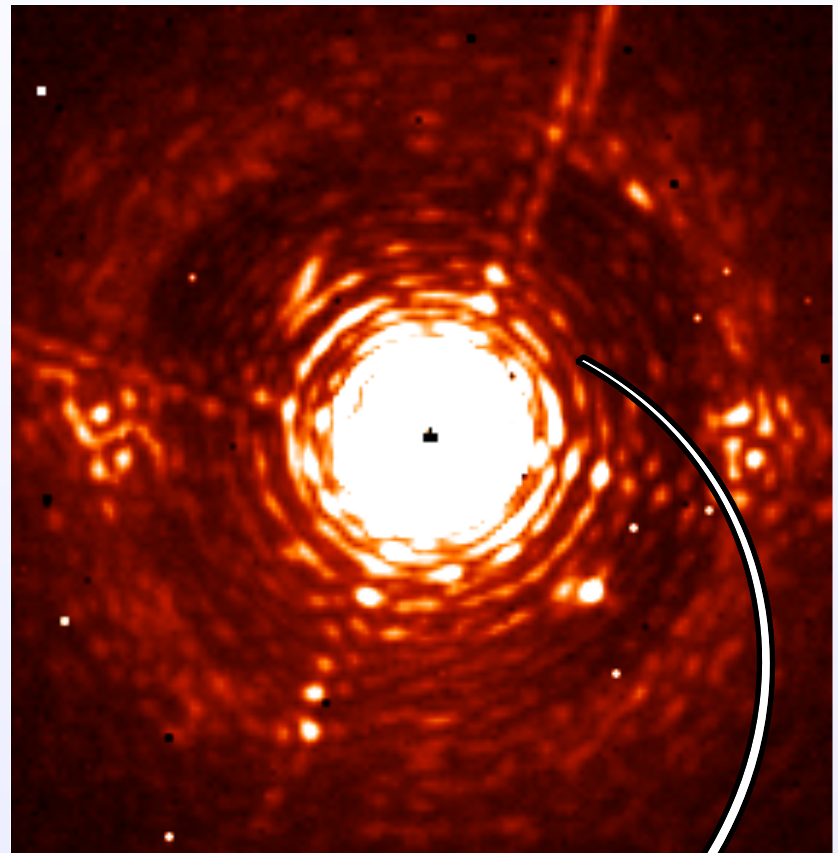
GPI @ Gemini-S

Extreme AO + coronagraphy in NIR

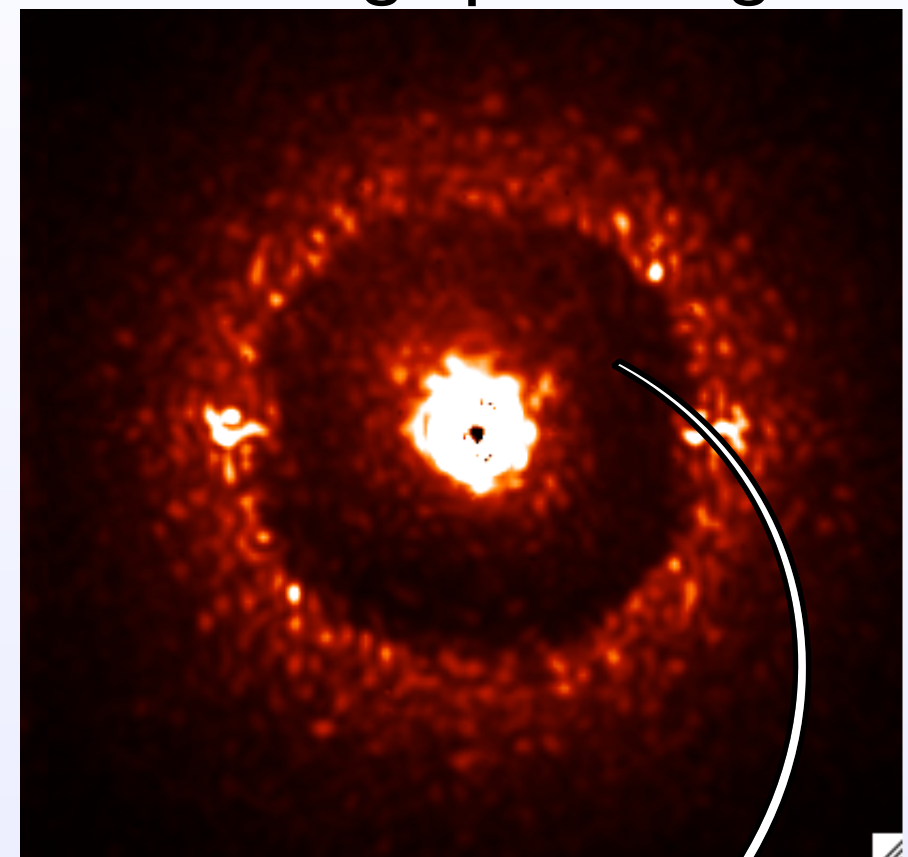
PSF



Saturated PSF



Coronagraphic image



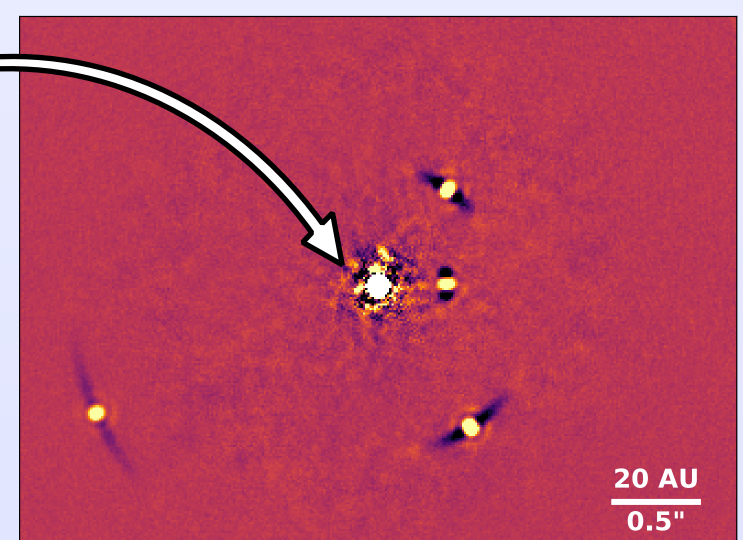
Diffraction limited within 20 λ/D

10^{-4}-10^{-5} contrast in dark zone

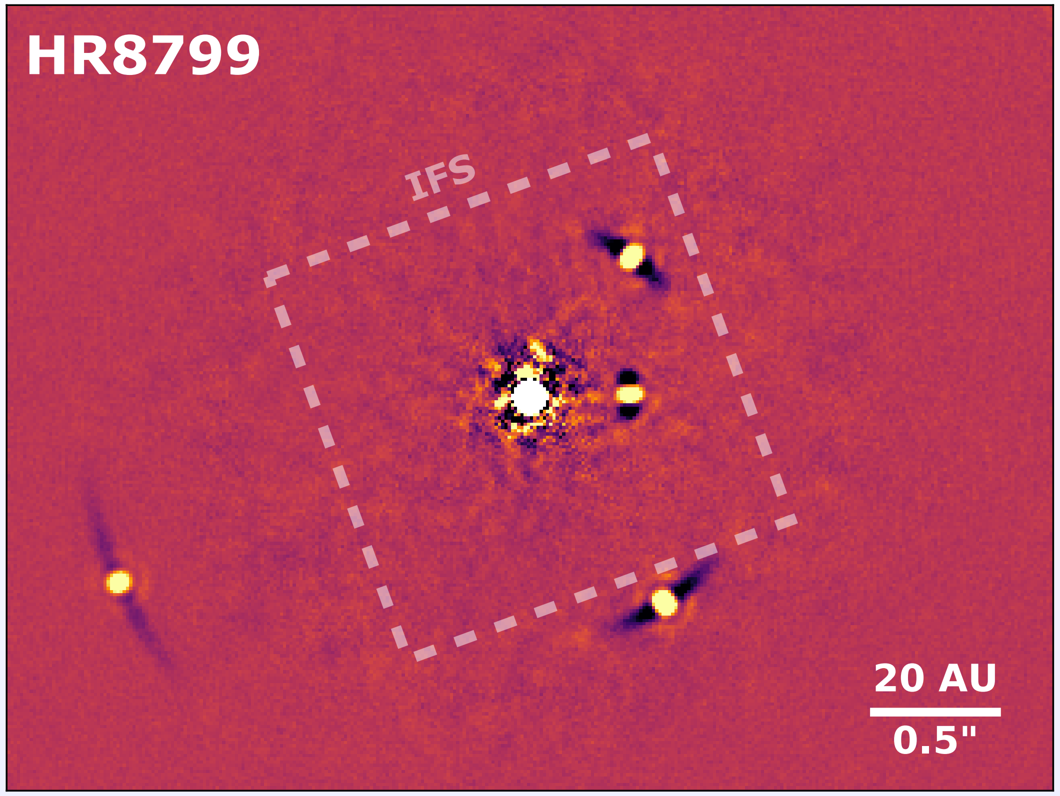
post-processing

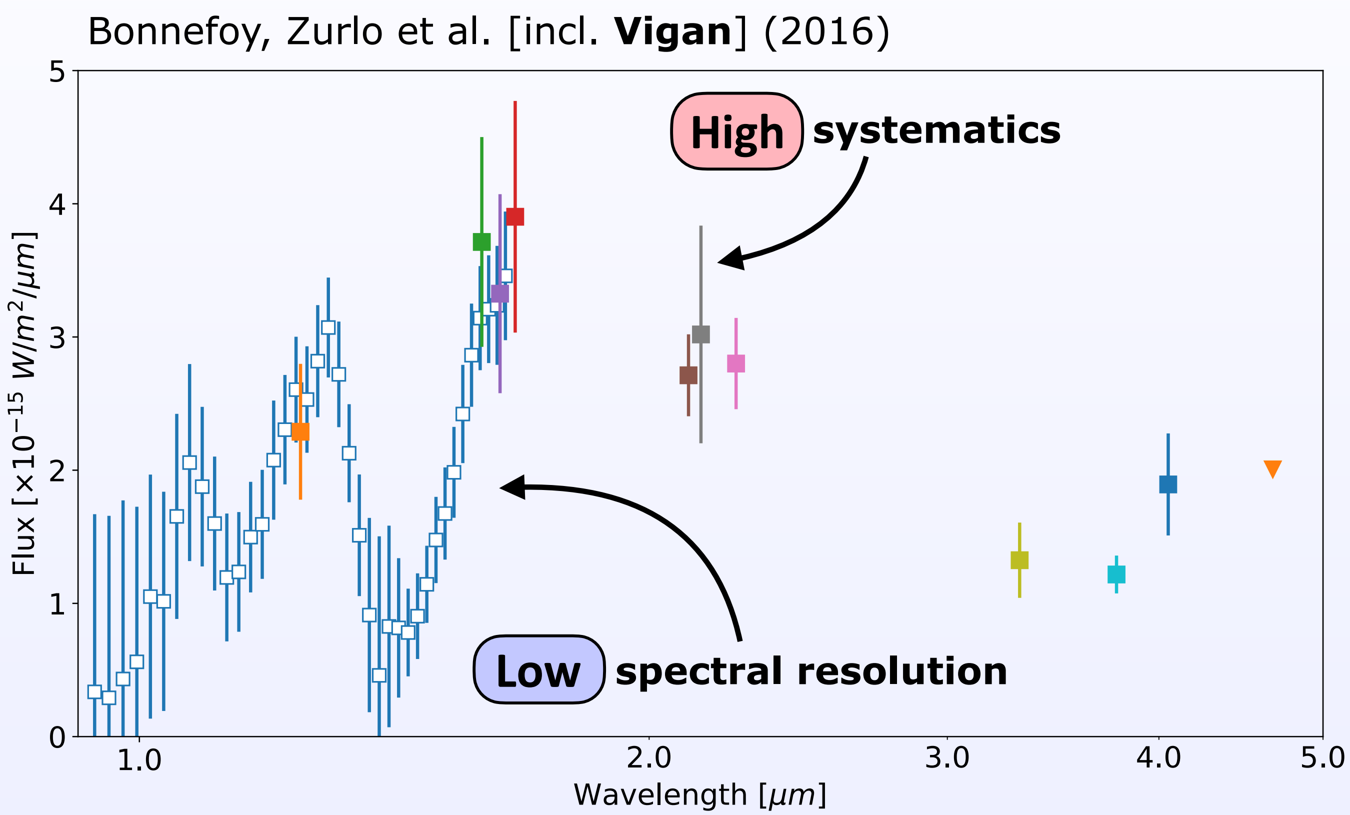
~10^{-5}-10^{-6} contrast down to 0.2"

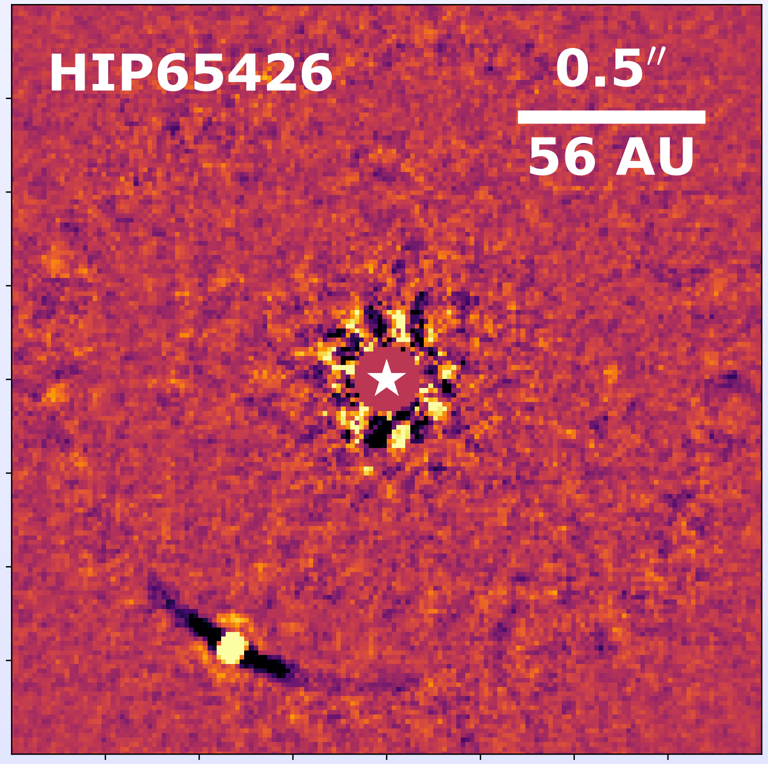
Enough to detect young giant exoplanets of a few Jupiter masses

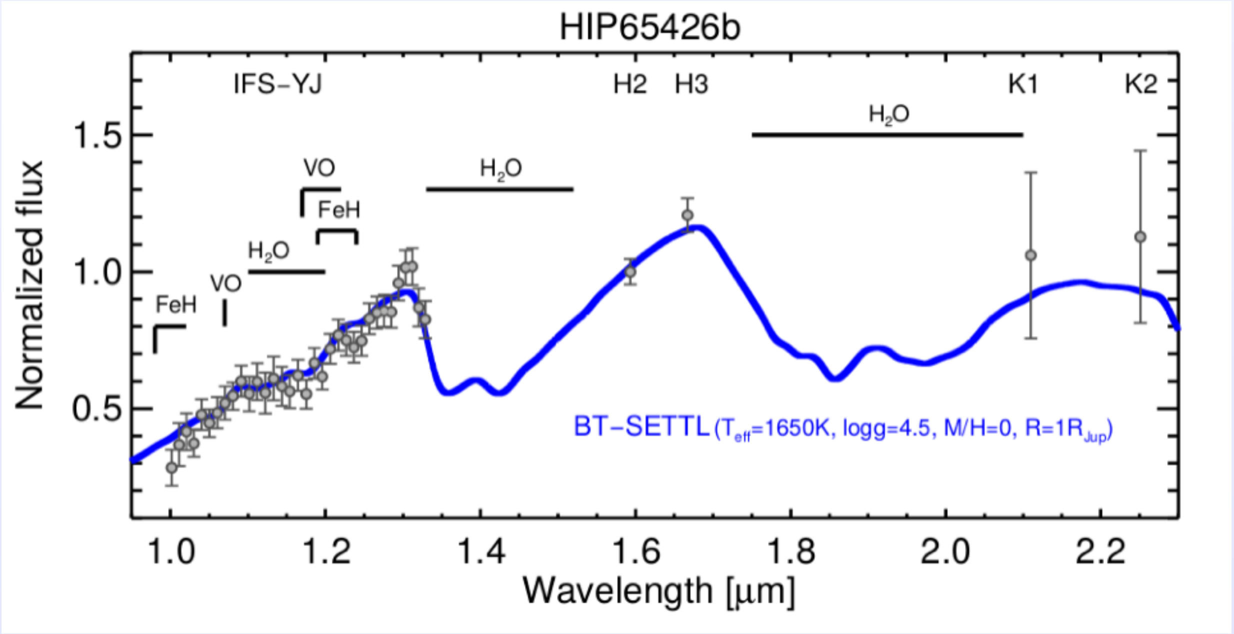


Exoplanet characterisation with SPHERE



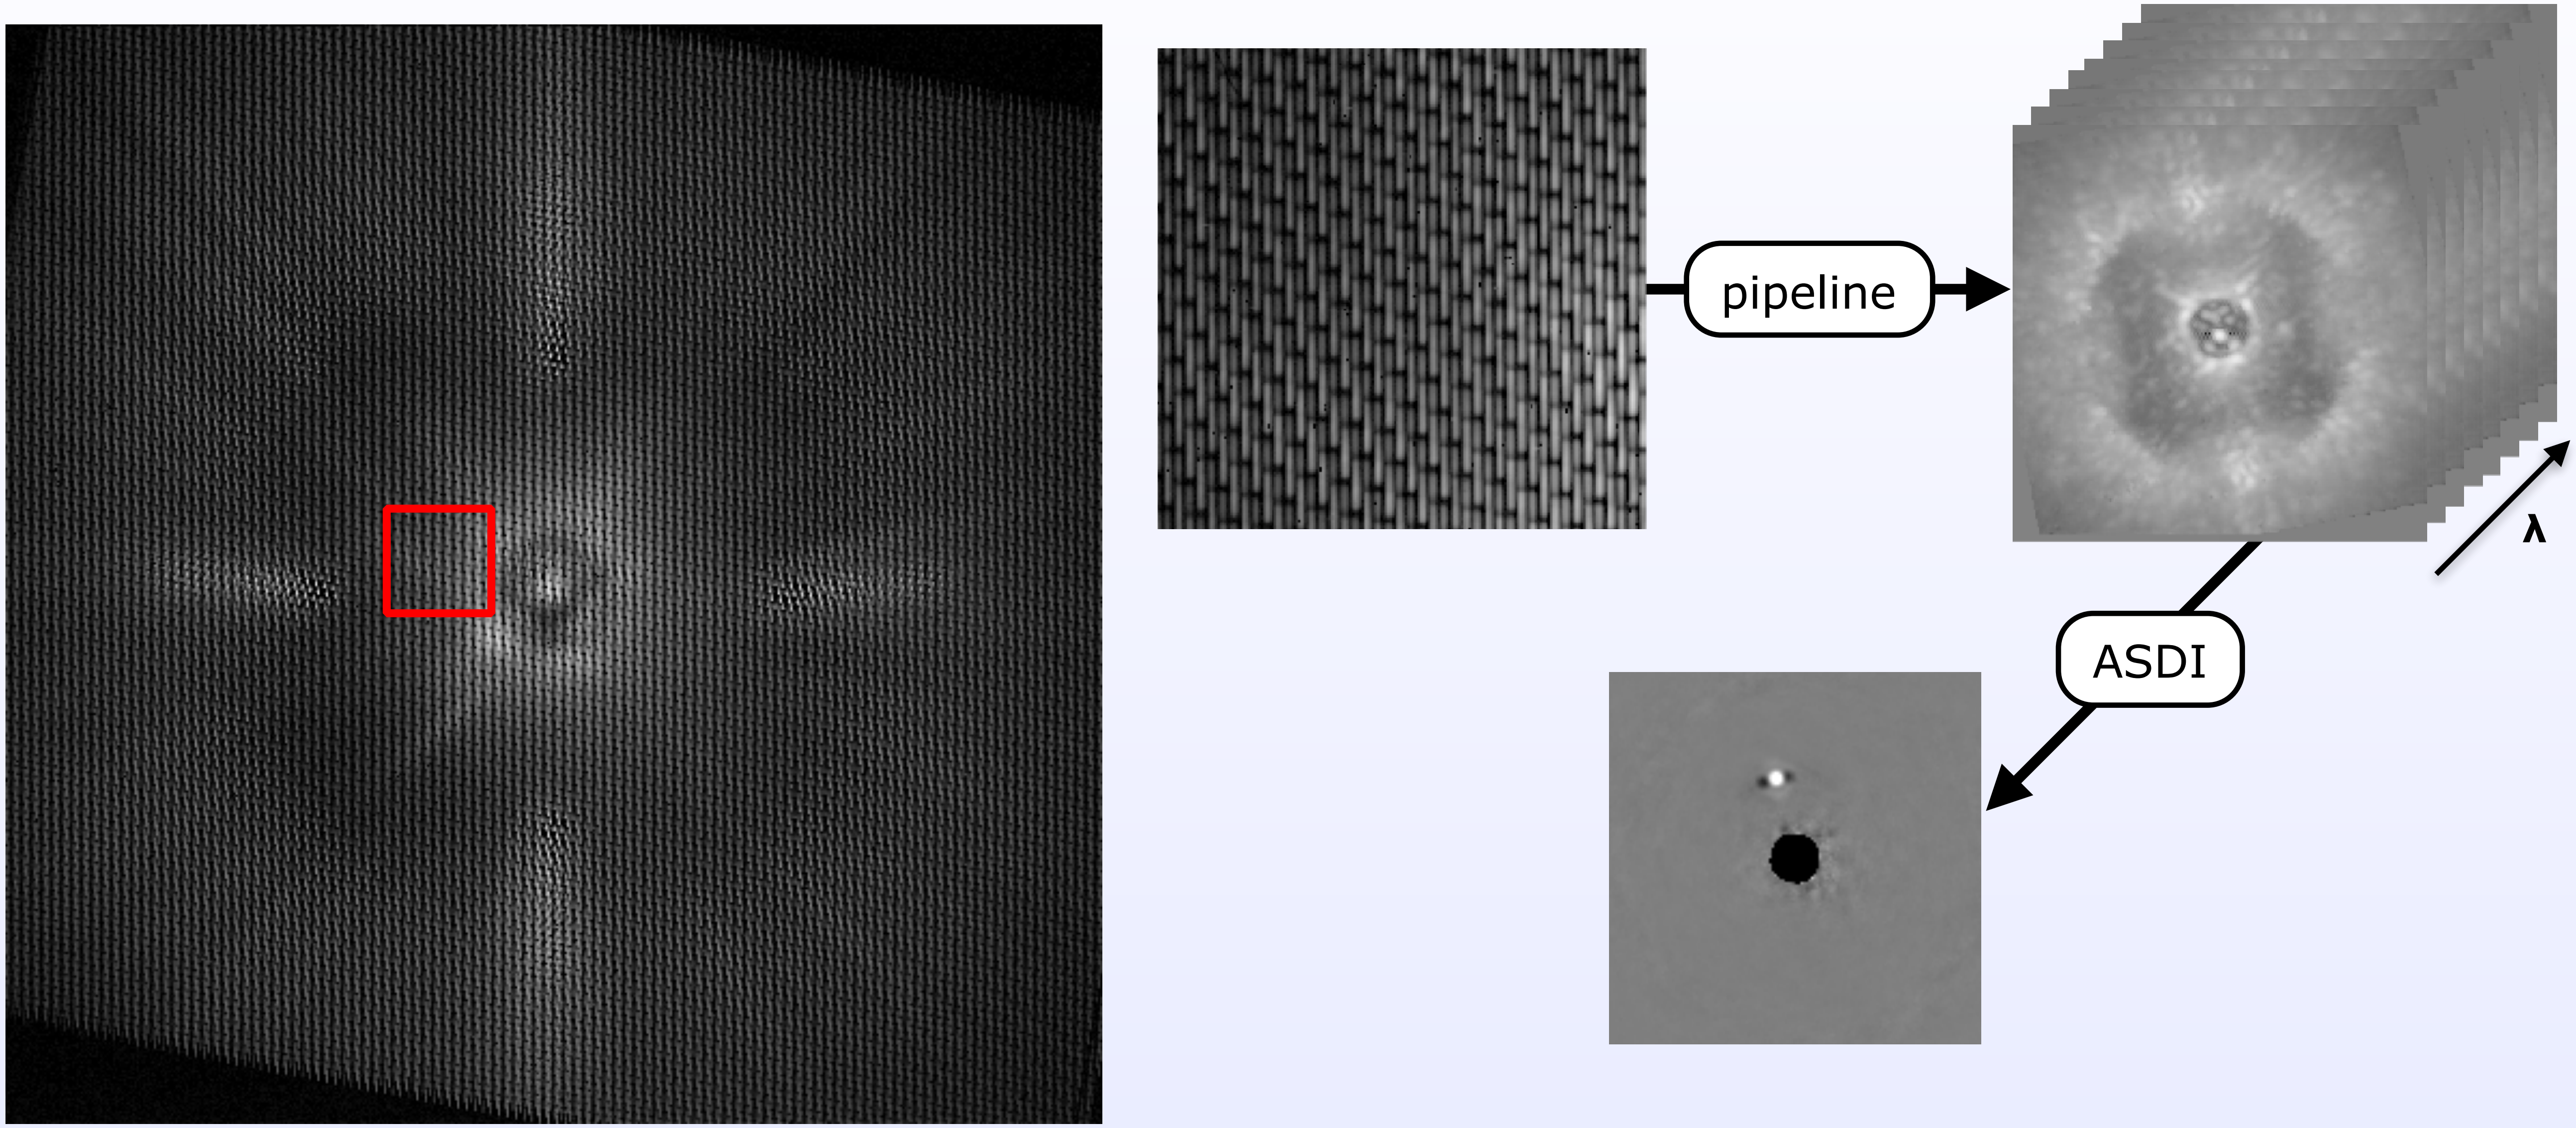






Resolution limited to R=50 for the IFS

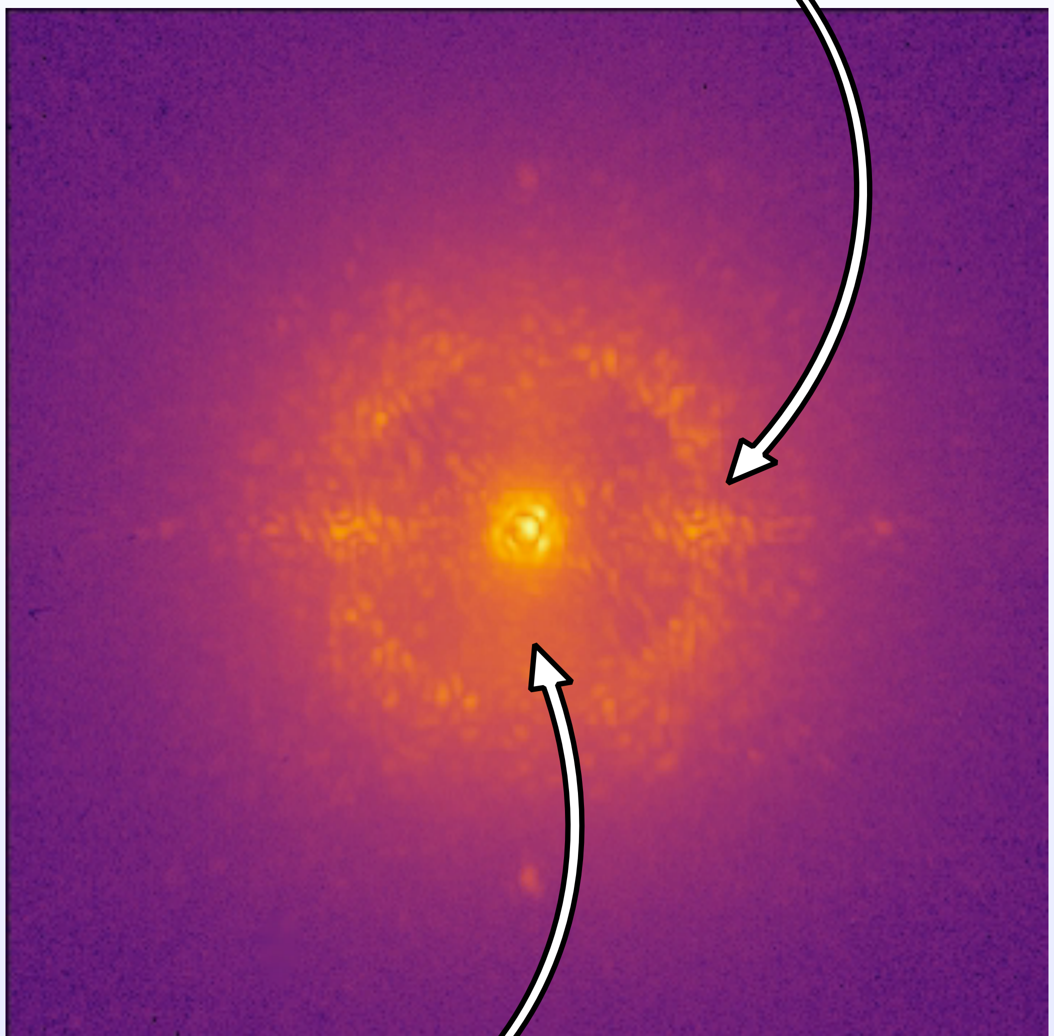
Low resolution by design

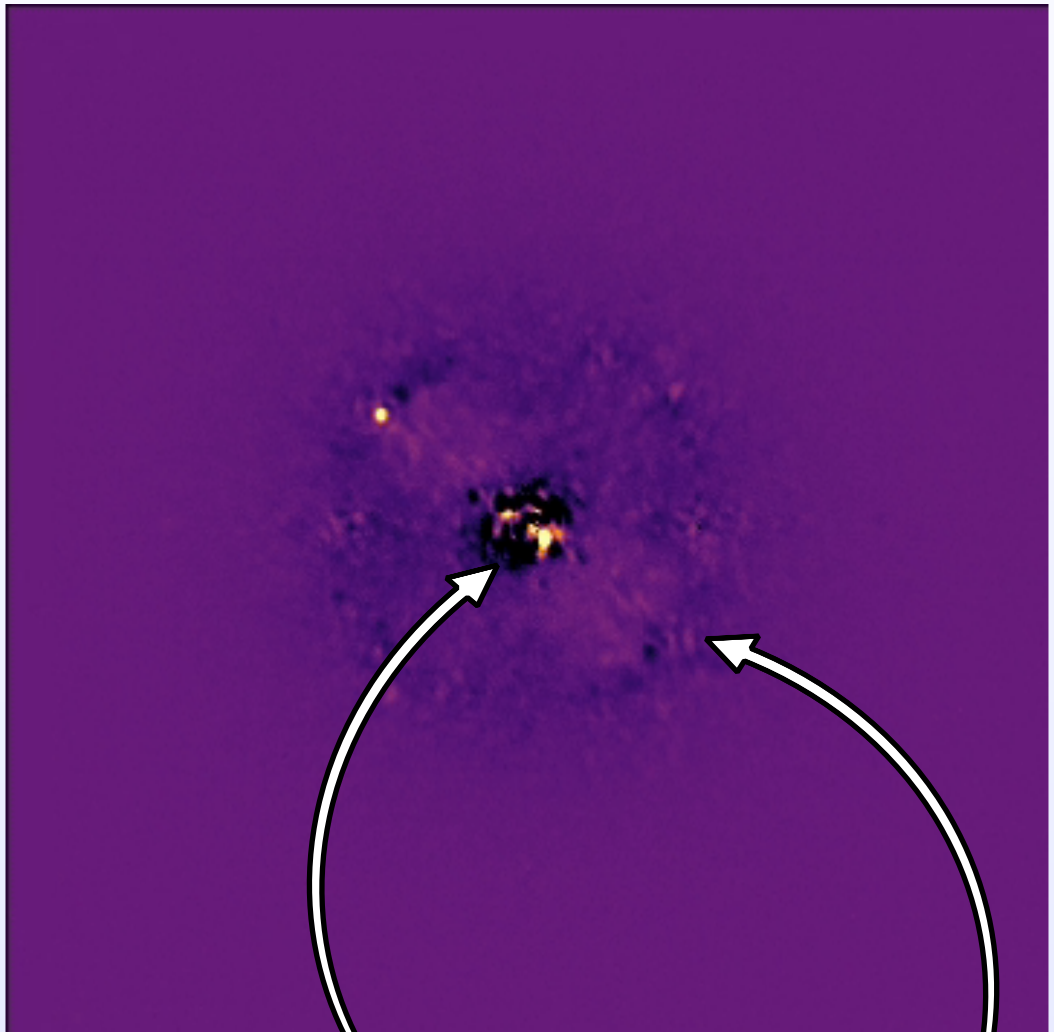


- IFS designed to **search for planets**: need for spatial & spectral information
  - Nyquist spatial sampling: 2 pixels/PSF at 0.95 µm
  - Number of pixels limited on a 2k*2k IR detector
- **Consequence:** maximum spectral resolution ~50 for YJ coverage (~30 for YJH)

Speckle noise limitation

long-lived, quasi-static speckles
cause by instrumental aberrations





AO residuals

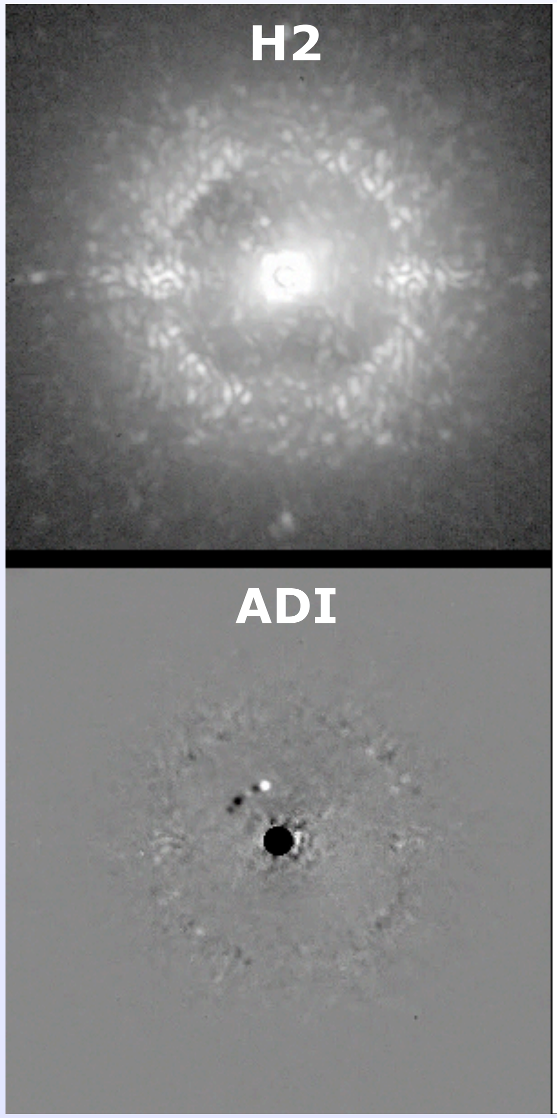
small variations because of
varying observing conditions,
thermal drift, etc

How to estimate and subtract the speckles?

Exoplanet direct detection techniques

Based on diversity intrinsic to or introduced in the data

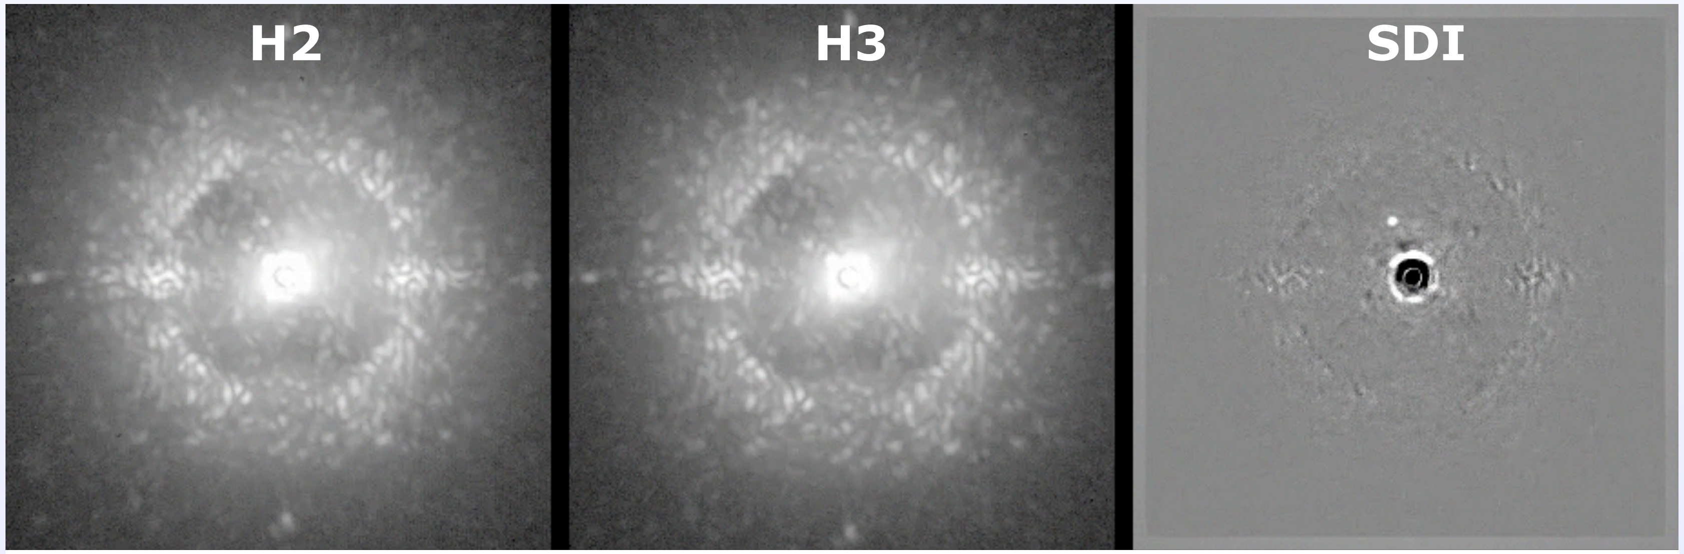
- **Angular diversity** ➝ angular differential imaging (ADI, cADI, LOCI, KLIP, ANDROMEDA, ...)

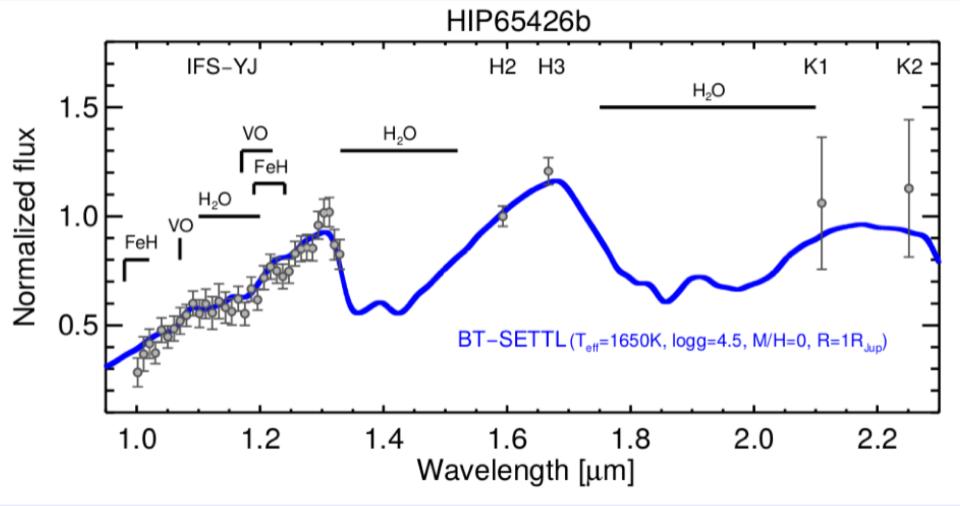


Exploplanet direct detection techniques

Based on diversity intrinsic to or introduced in the data

- Angular diversity ➙ angular differential imaging (ADI, cADI, LOCI, KLIP, ANDROMEDA, ...)
- Spectral diversity ➙ spectral differential imaging (SDI, SD, SSDI)

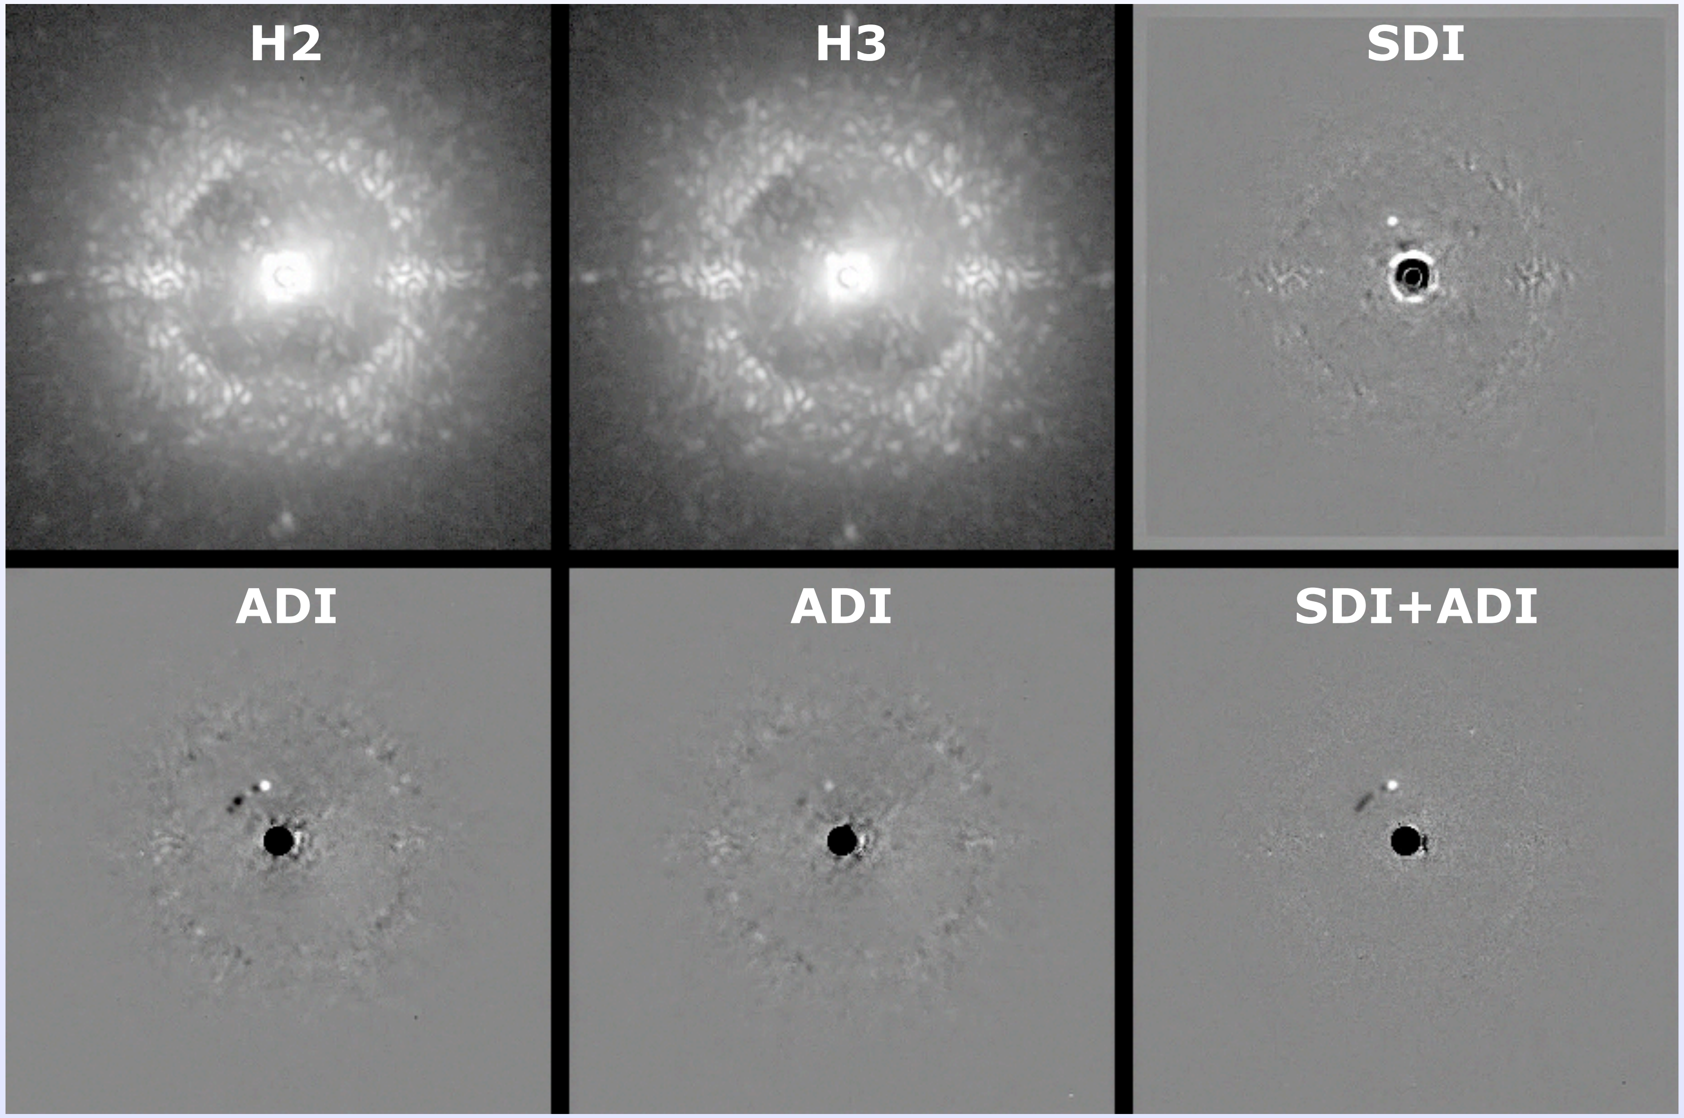


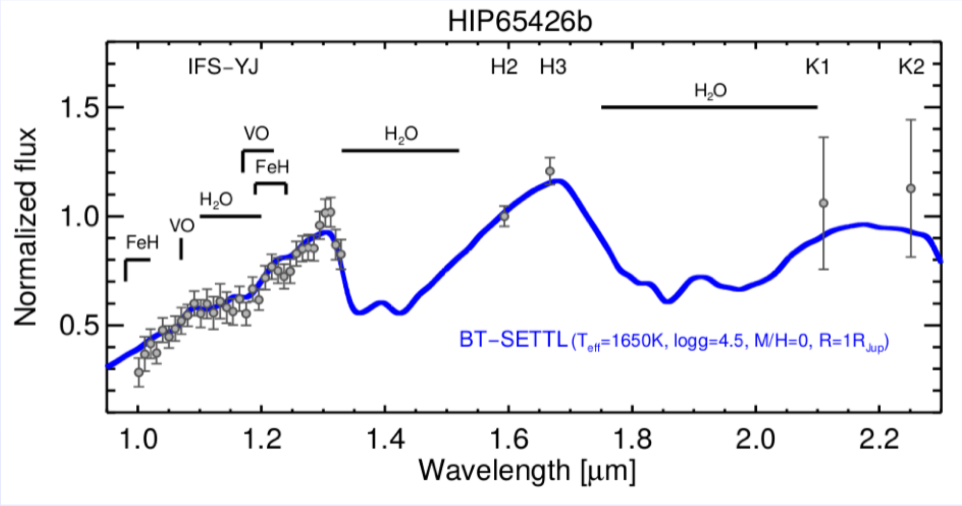


Exoplanet direct detection techniques

Based on diversity intrinsic to or introduced in the data

- Angular diversity ➙ angular differential imaging (ADI, cADI, LOCI, KLIP, ANDROMEDA, ...)
- Spectral diversity ➙ spectral differential imaging (SDI, SD, SSDI)

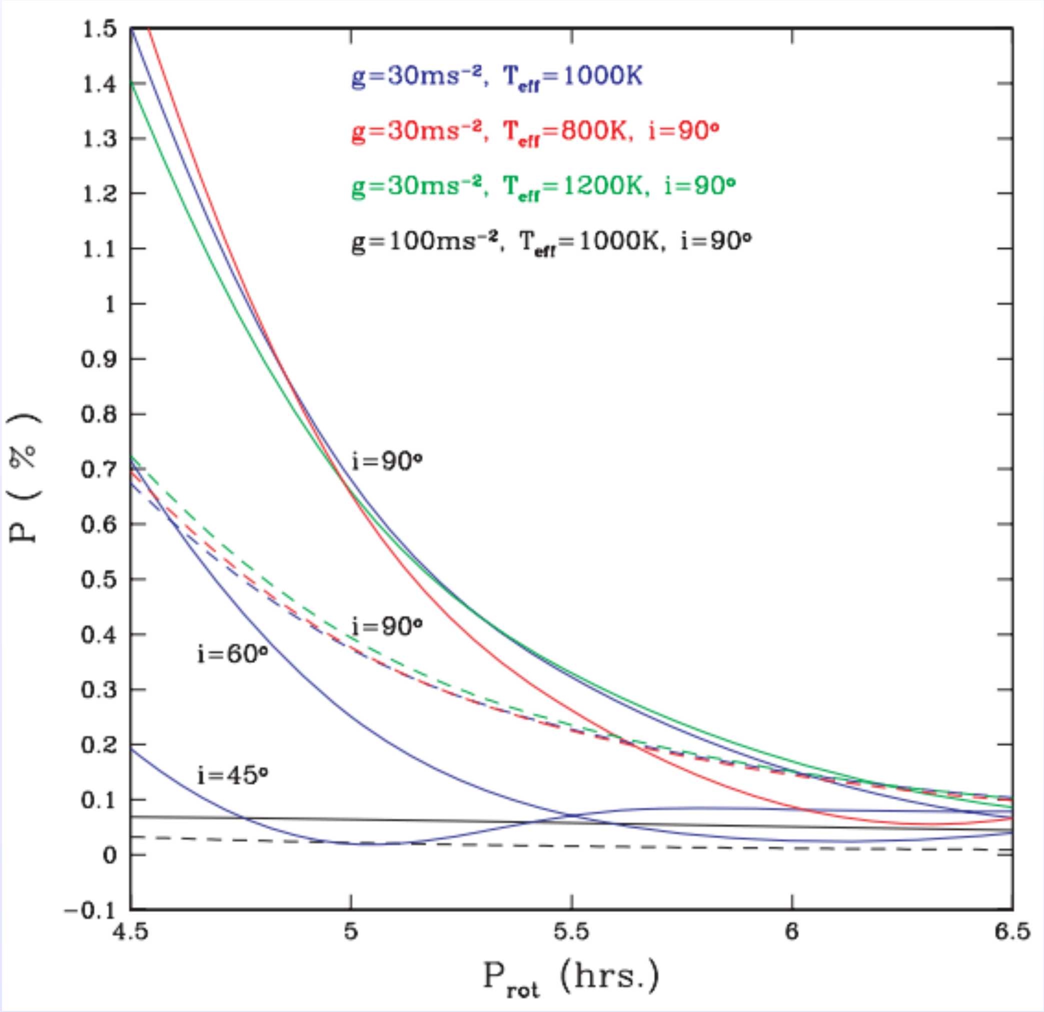




Exoplanet direct detection techniques

Based on diversity intrinsic to or introduced in the data

- **Angular diversity** ➙ angular differential imaging (ADI, cADI, LOCI, KLIP, ANDROMEDA, ...)
- **Spectral diversity** ➙ spectral differential imaging (SDI, SD, SSDI)
- **Polarimetric diversity** ➙ polarimetric differential imaging (PDI, DPI)



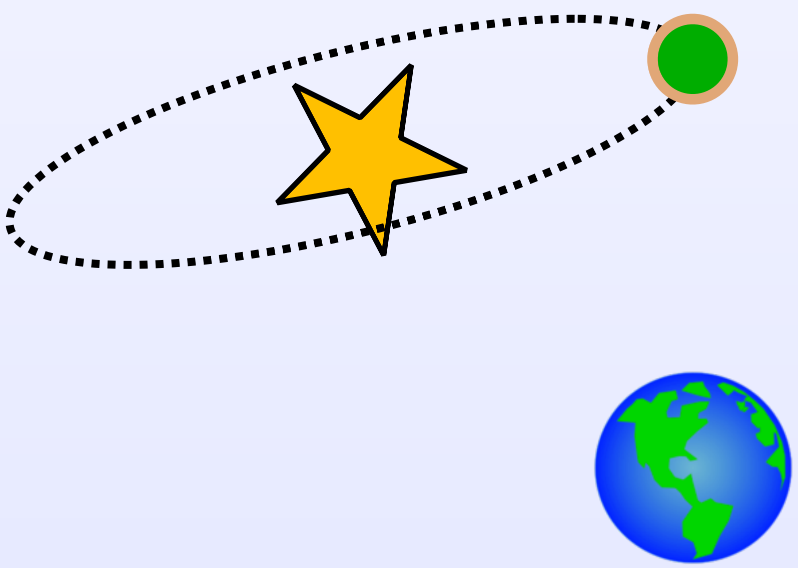
Marley & Sengupta (2011)

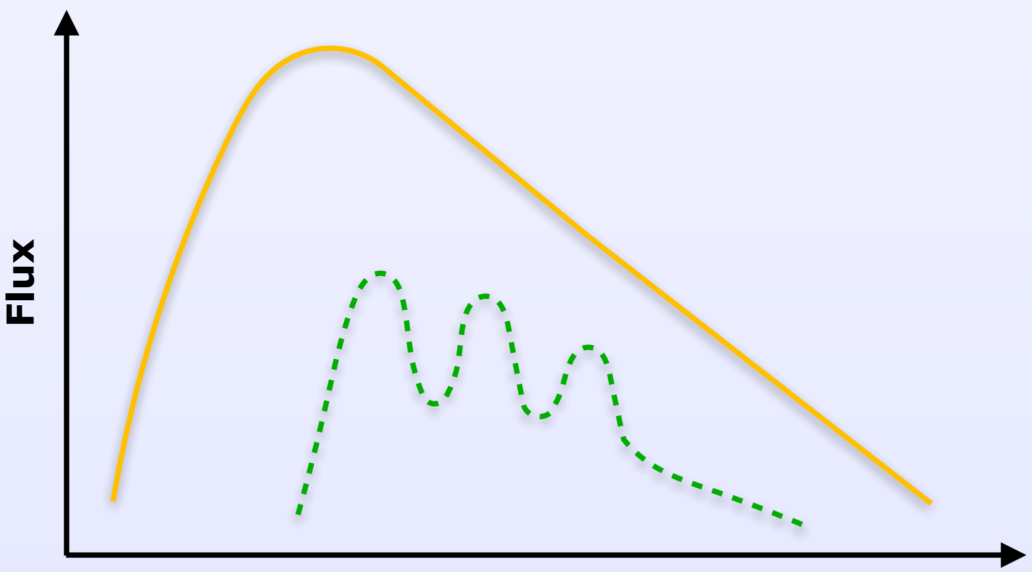
Polarisation induced by surface inhomogeneities (clouds) or oblateness of the planet

Exoplanet direct detection techniques

Based on diversity intrinsic to or introduced in the data

- **Angular diversity** → angular differential imaging (ADI, cADI, LOCI, KLIP, ANDROMEDA, ...)
- **Spectral diversity** → spectral differential imaging (SDI, SD, SSDI)
- **Polarimetric diversity** → polarimetric differential imaging (PDI, DPI)
- **Velocity diversity**

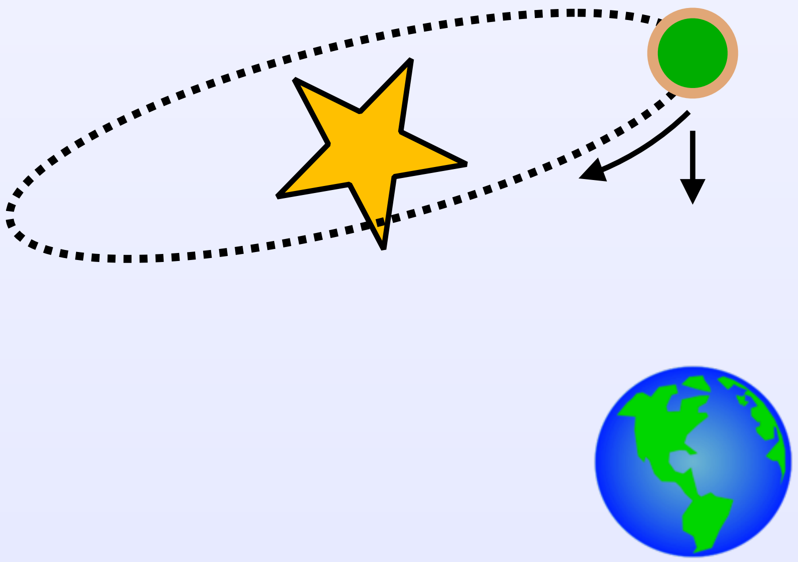


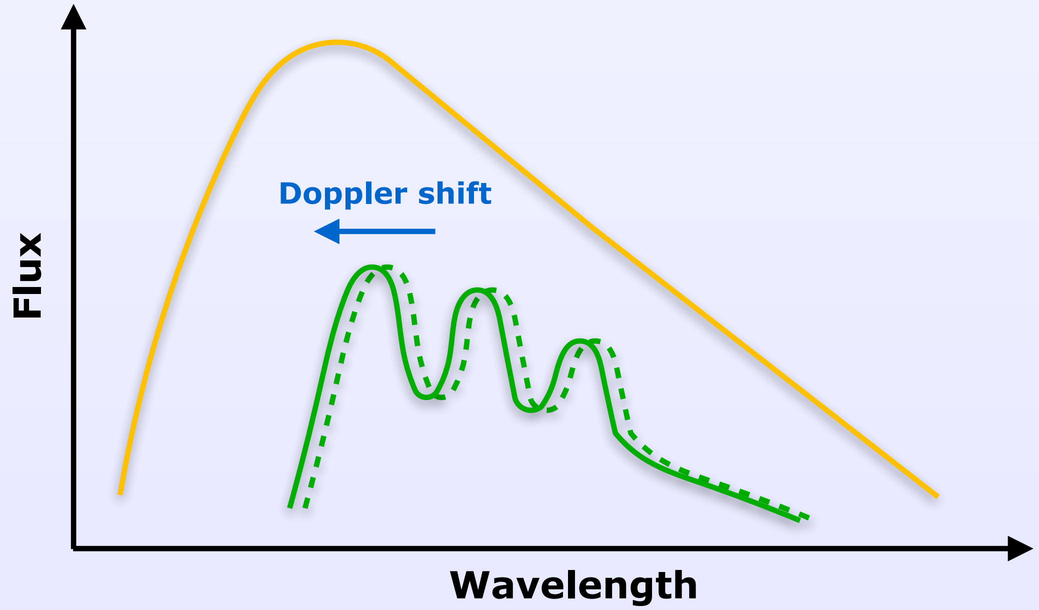


Exoplanet direct detection techniques

Based on diversity intrinsic to or introduced in the data

- Angular diversity ➝ angular differential imaging (ADI, cADI, LOCI, KLIP, ANDROMEDA, ...)
- Spectral diversity ➝ spectral differential imaging (SDI, SD, SSDI)
- Polarimetric diversity ➝ polarimetric differential imaging (PDI, DPI)
- Velocity diversity



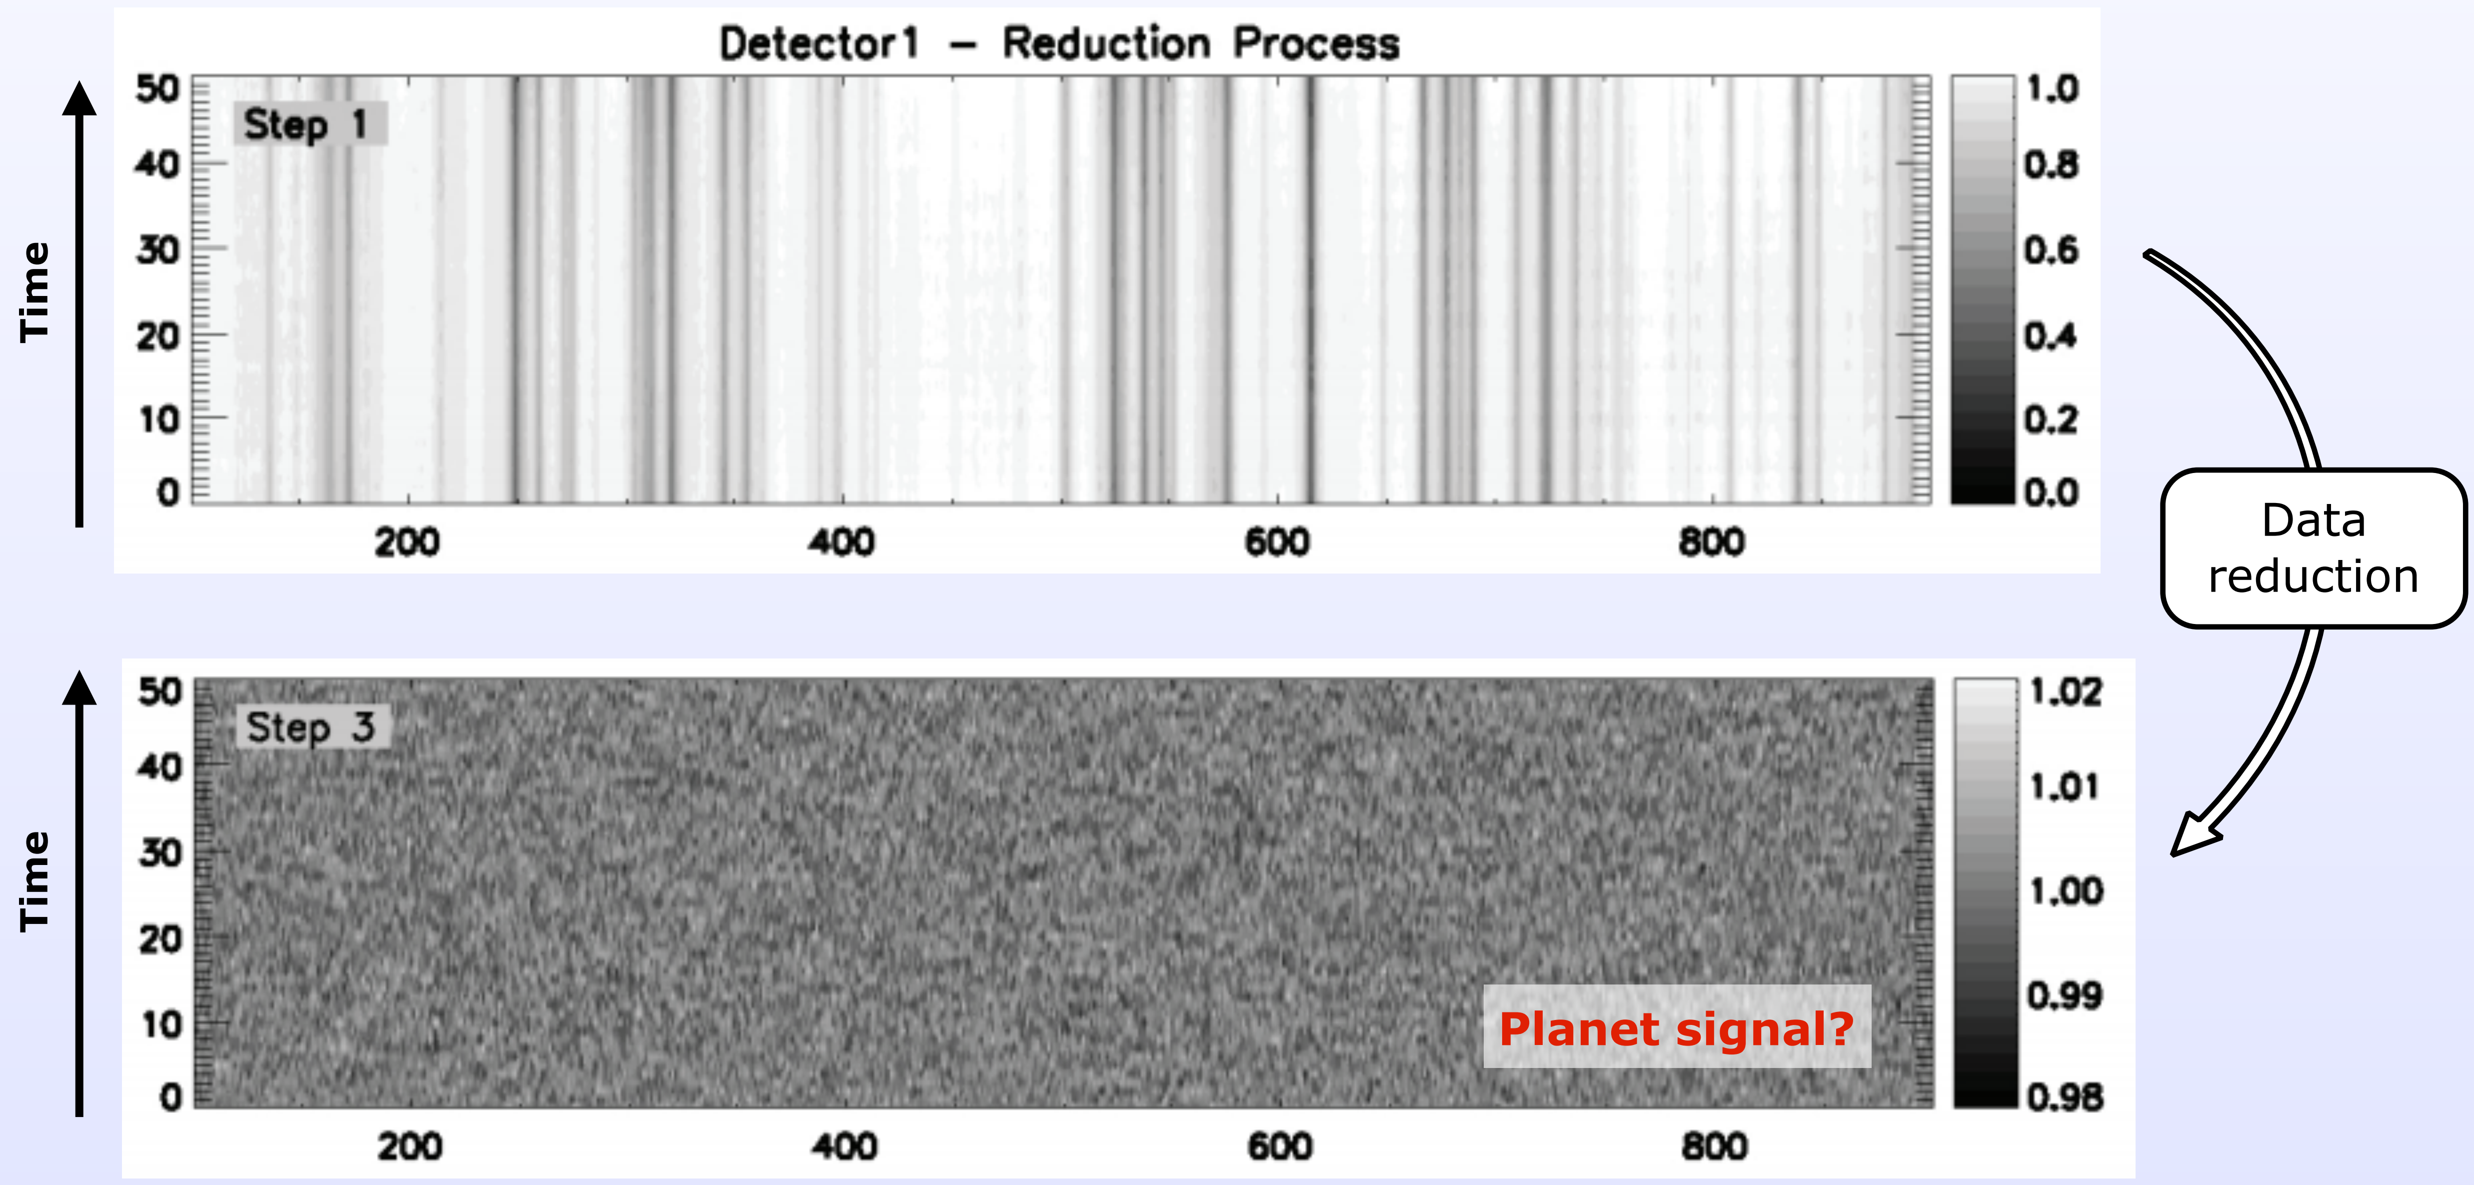


➝ Resolution of at least a few 10^3 or 10^4 needed to resolve molecular lines in the planet spectrum

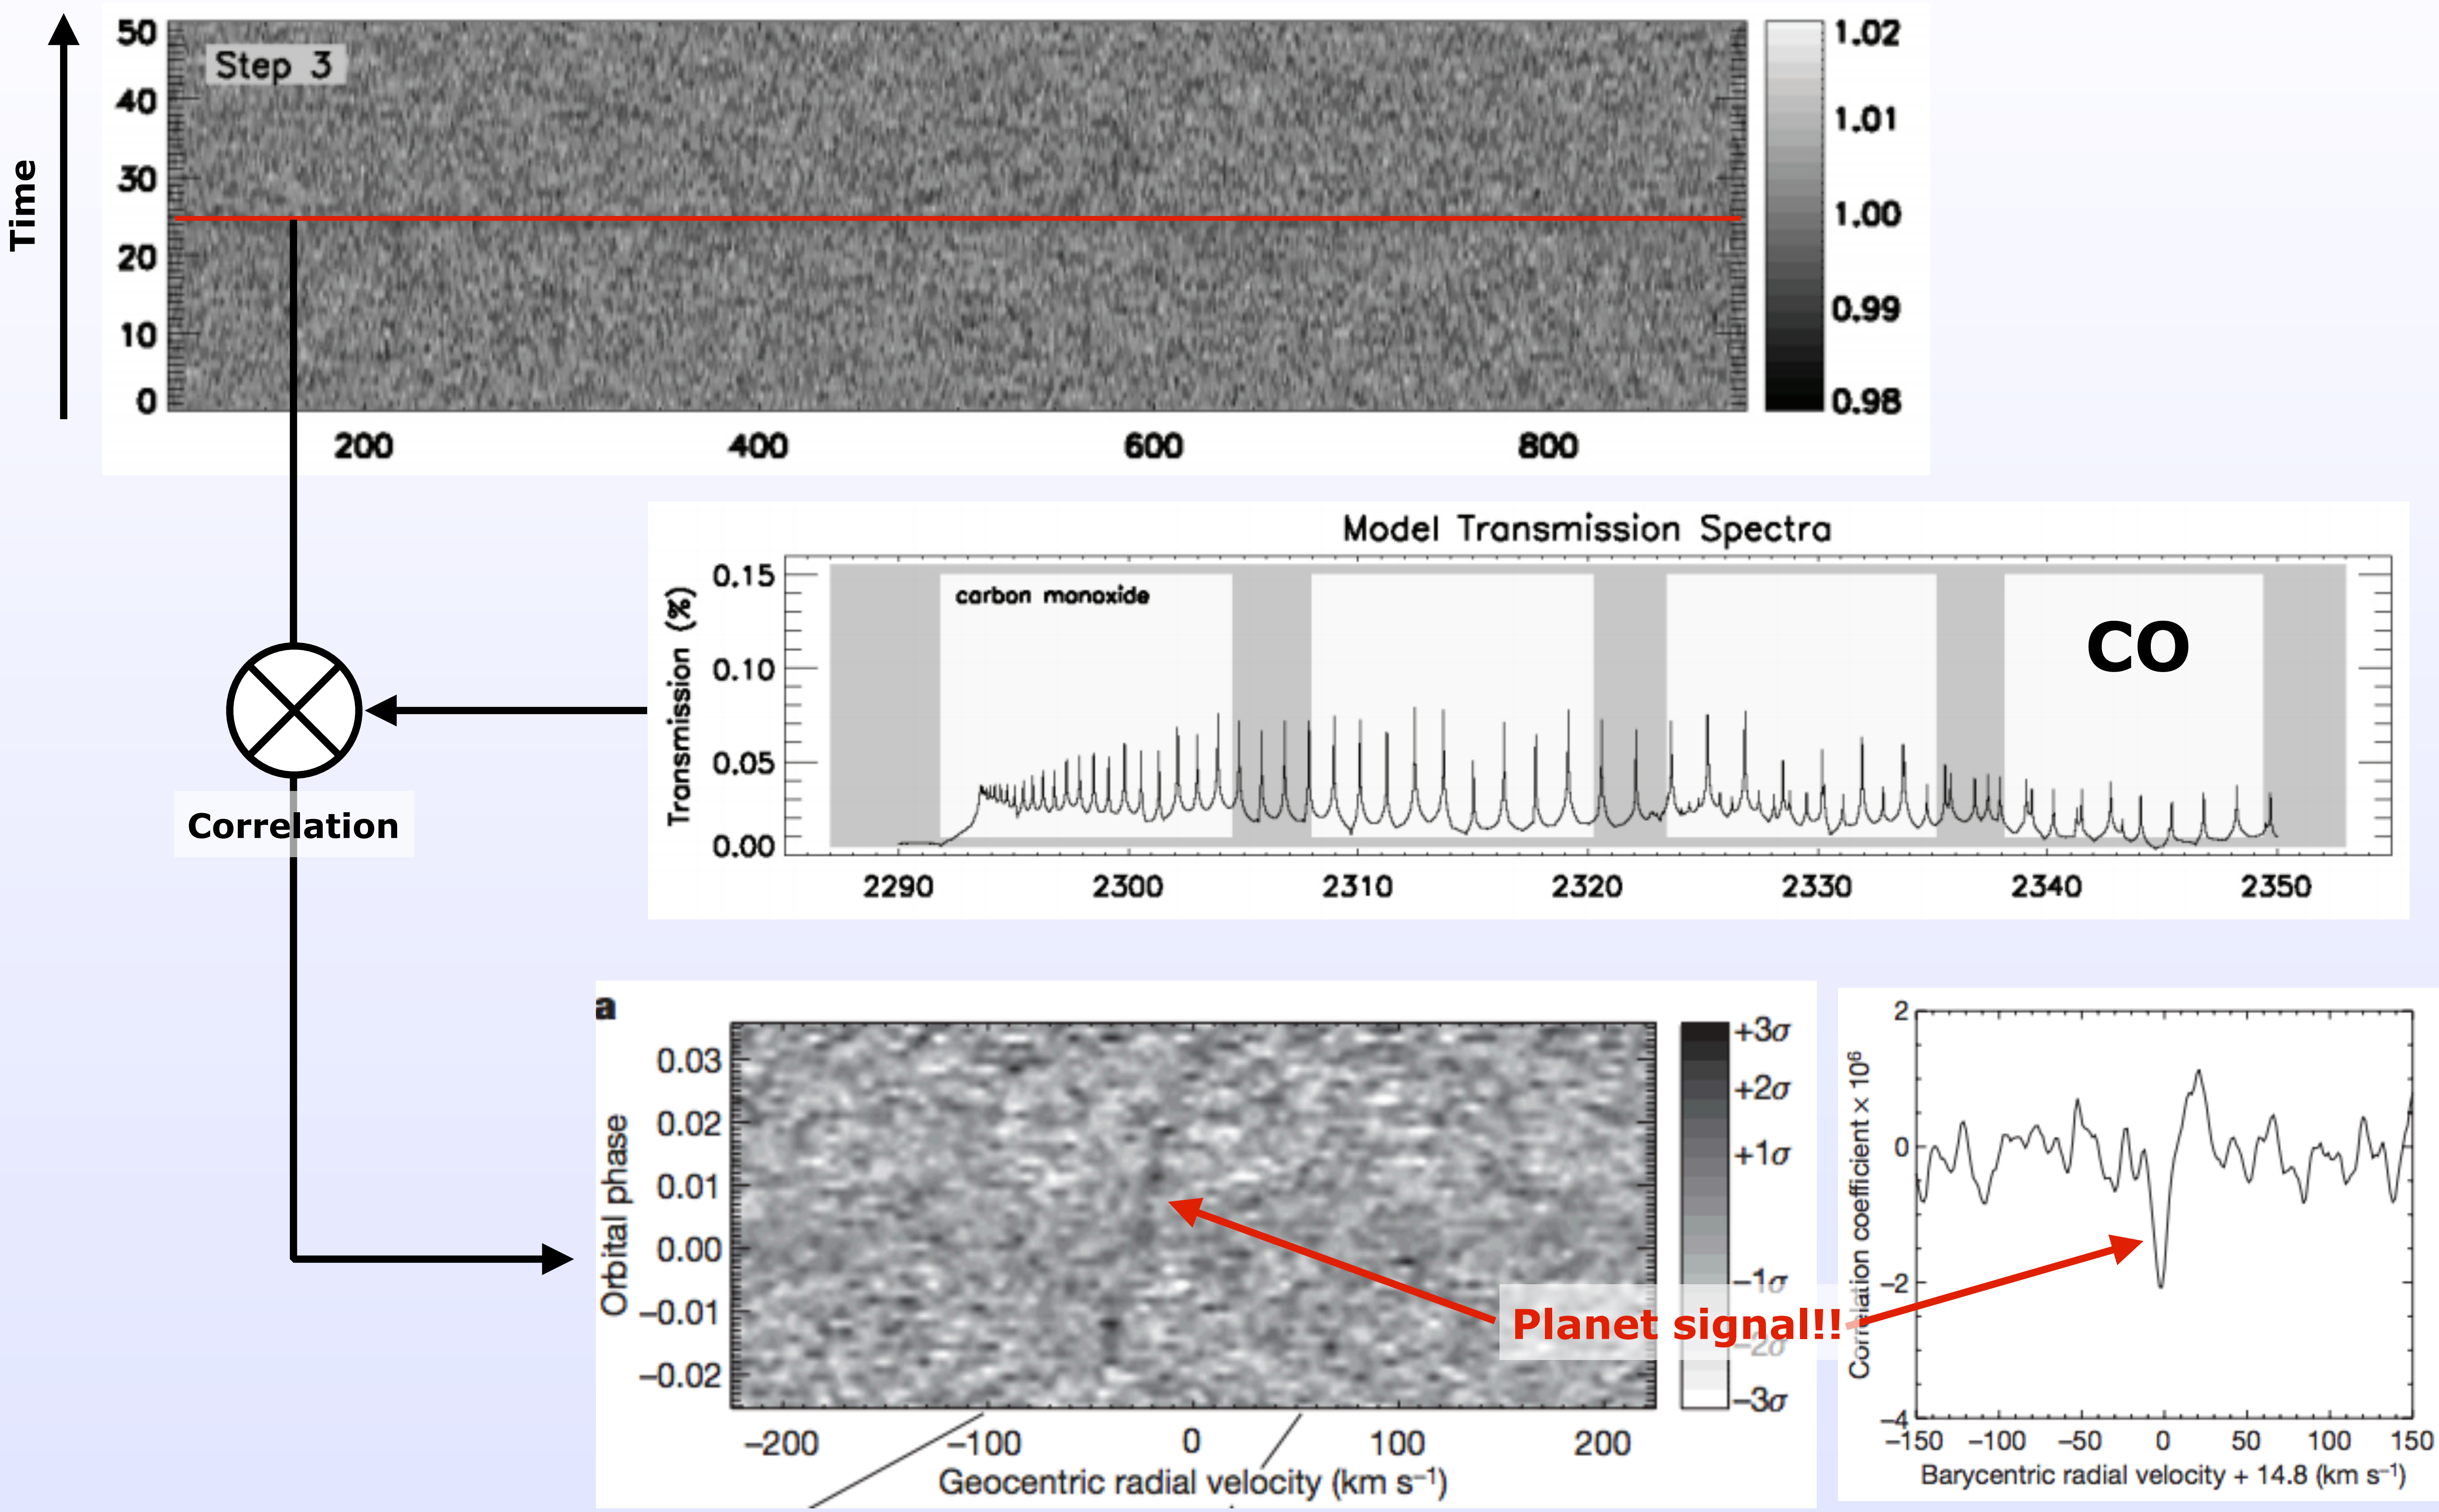
Spectral + velocity diversity

Proposed by Snellen et al. (2010) for hot Jupiters

- Demonstrated on HD209458 b: period of 3.5 days, transit
- Data taken with CRIRES in K-band at R=~80 000



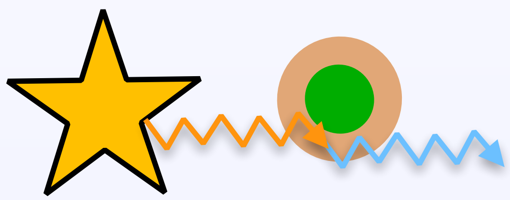
Spectral + velocity diversity



Spectral + velocity diversity

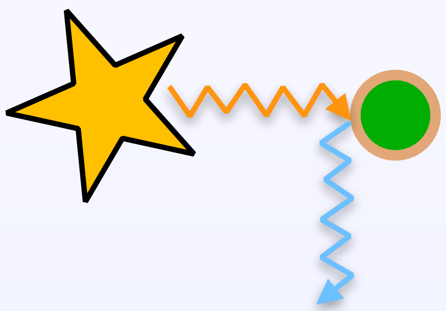
Absorption

HD209458 b (Snellen et al. 2010)



Reflection

51 Peg b (Martins et al. 2016)



Emission

HR8799 c (Konopacky et al. 2013)

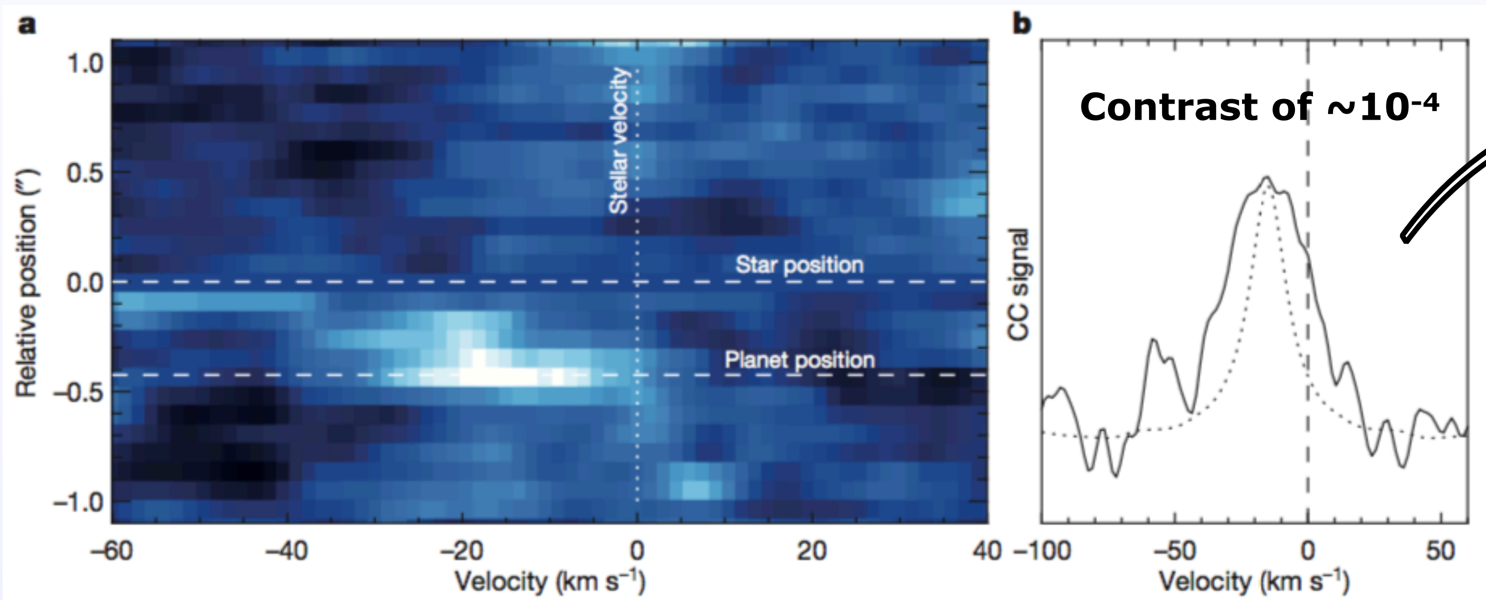
- Why does it work?
  - **strong spectral features** expected for CO, CO_2, CH_4, H_20
  - **many lines** in near-infrared

$$S/N = \frac{S_{\rm planet}}{\sqrt{S_{\rm star} + \sigma^2_{\rm bg} + \sigma^2_{\rm RN} + \sigma^2_{\rm Dark}}} \sqrt{N_{\rm lines}},$$

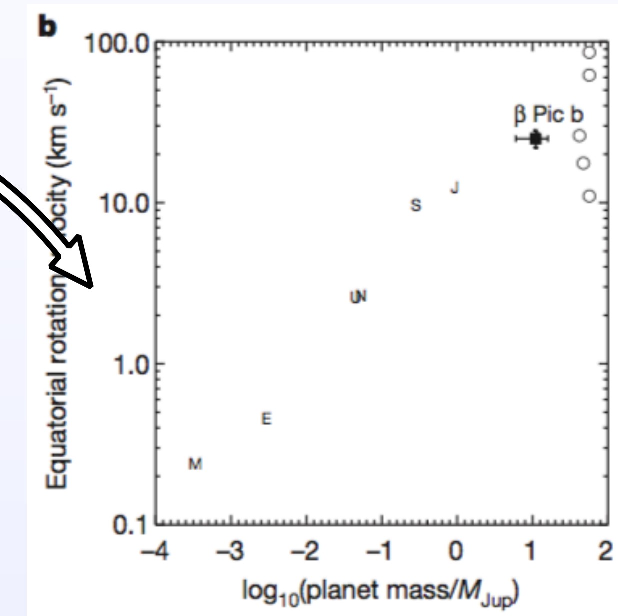
- Limitations?
  - contrast between star and planet!
  - current limit at 10^{-5} on τ Boo (Hoeijmakers et al. 2017)

Combining HCI and HRS

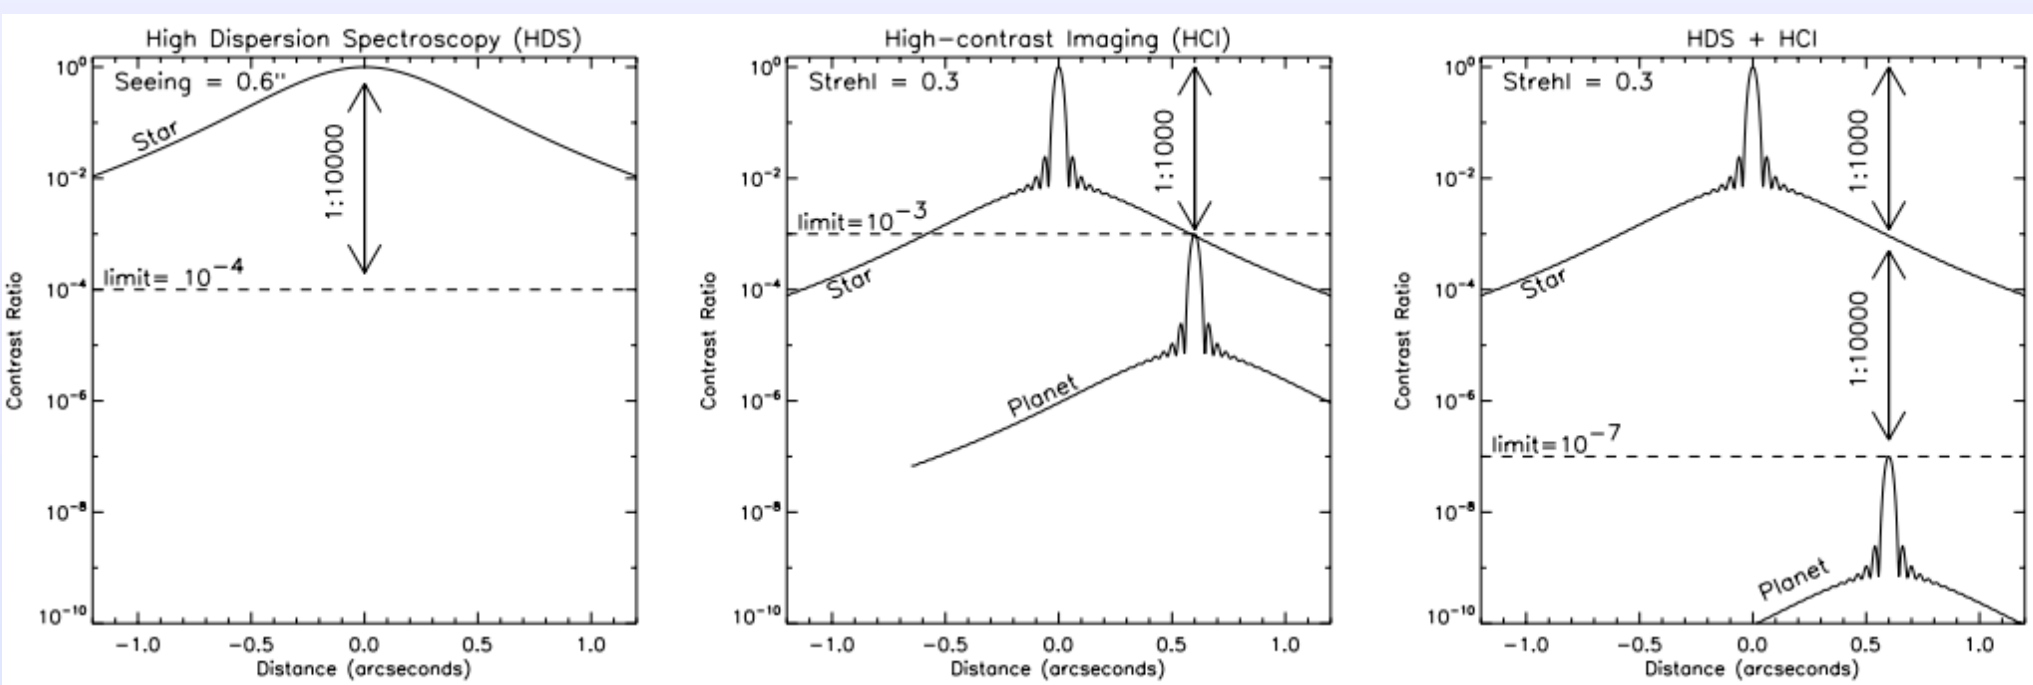
- Nicely demonstrated on ß Pic b with CRIRES+ in K-band using CO templates:

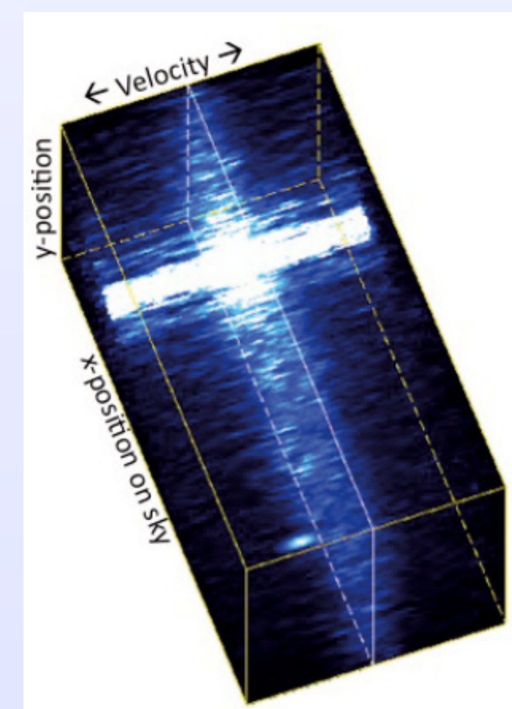


Rot. broadening



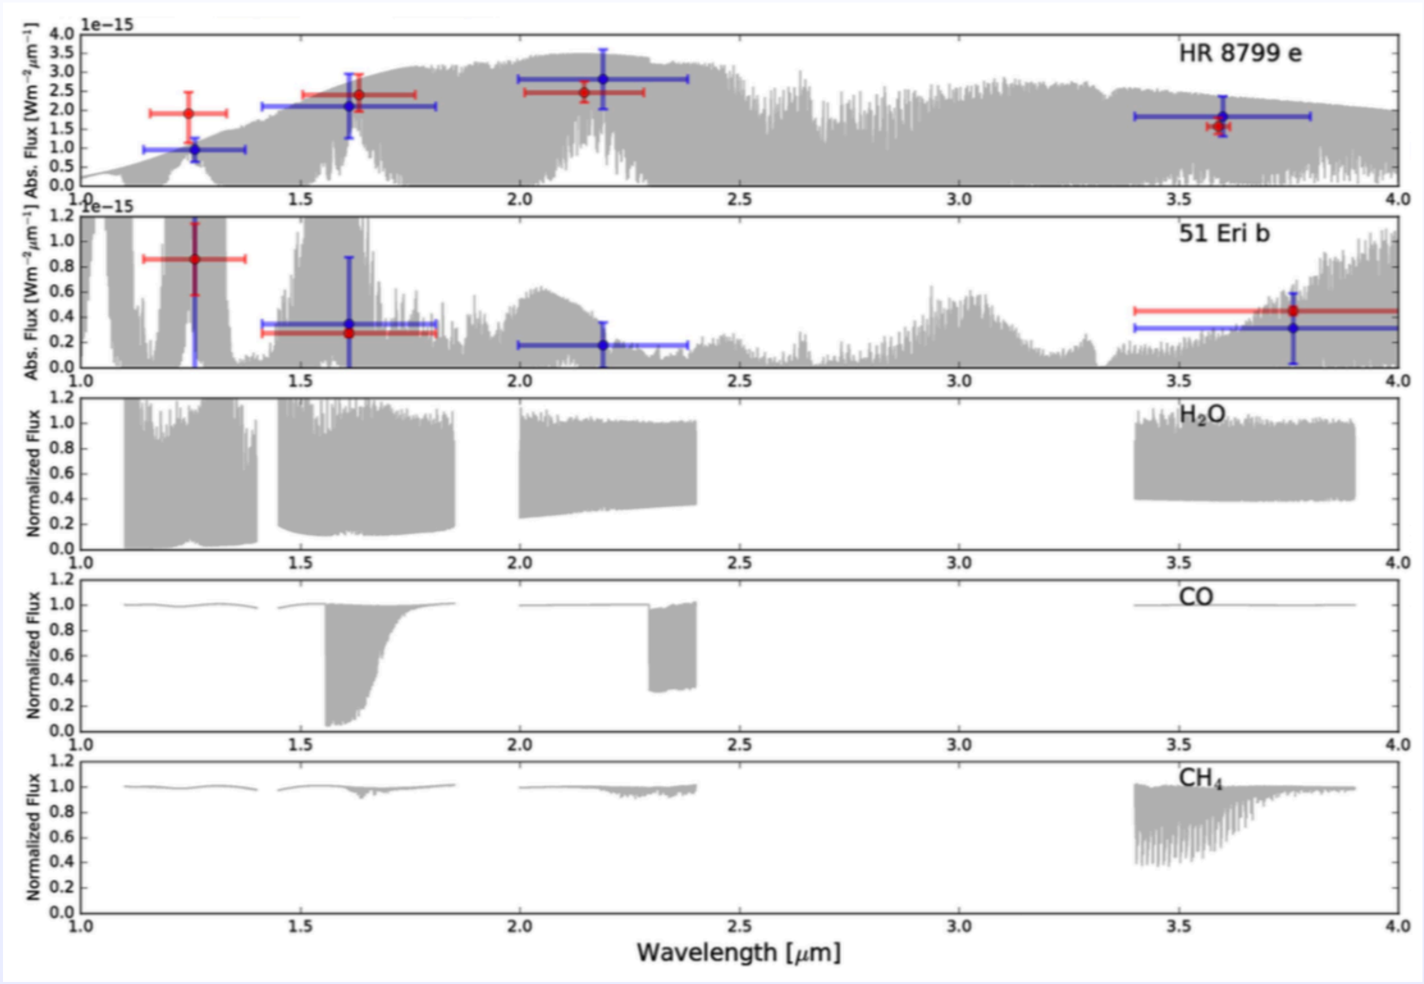
- HCI + HRS: ideal combination to reach contrasts better than 10^{-6} (Snellen et al. 2015)

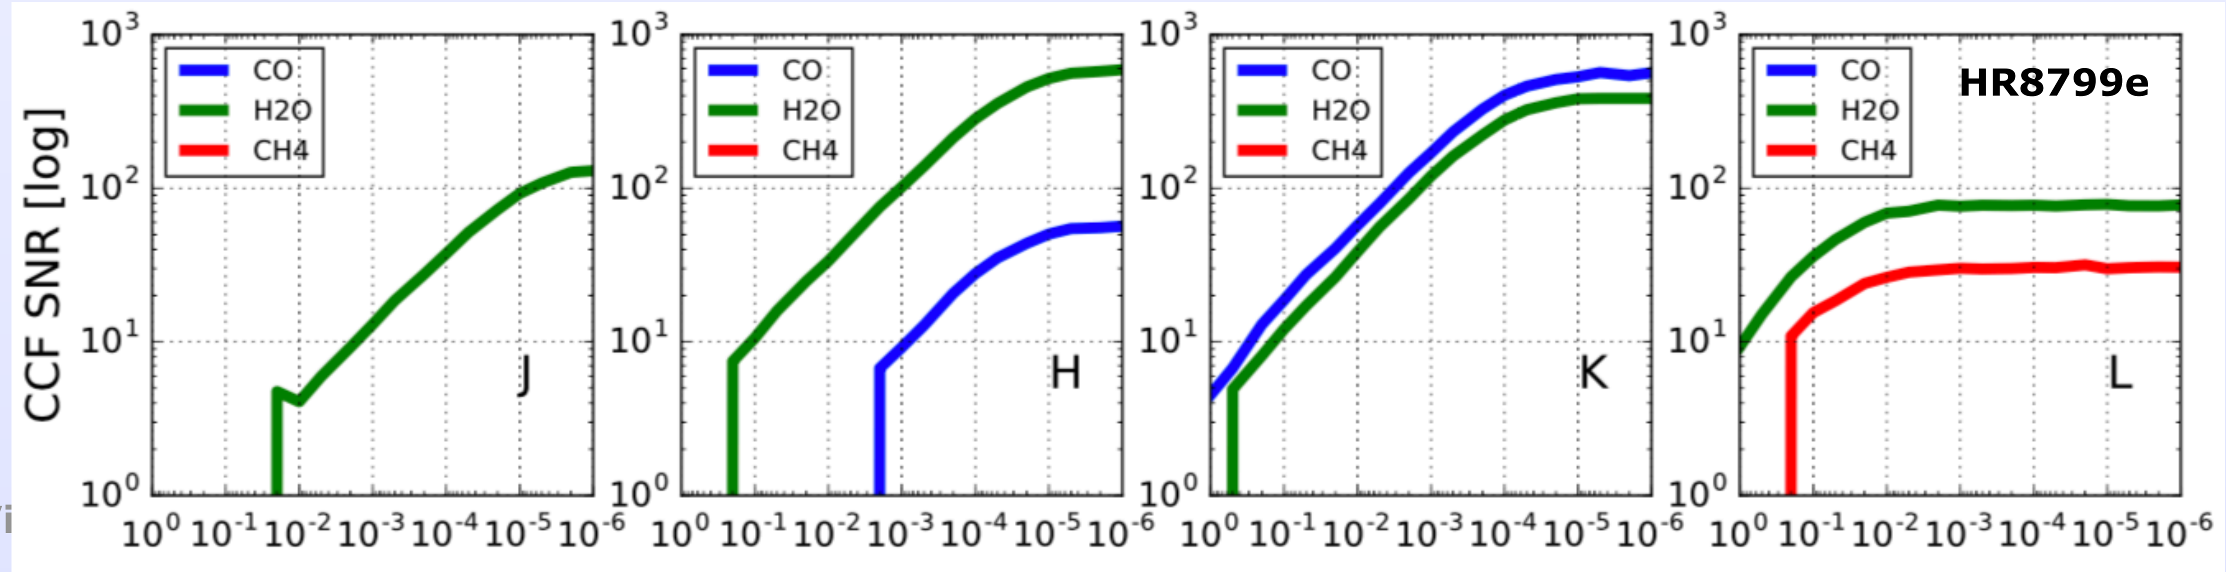




Combining HCI and HRS

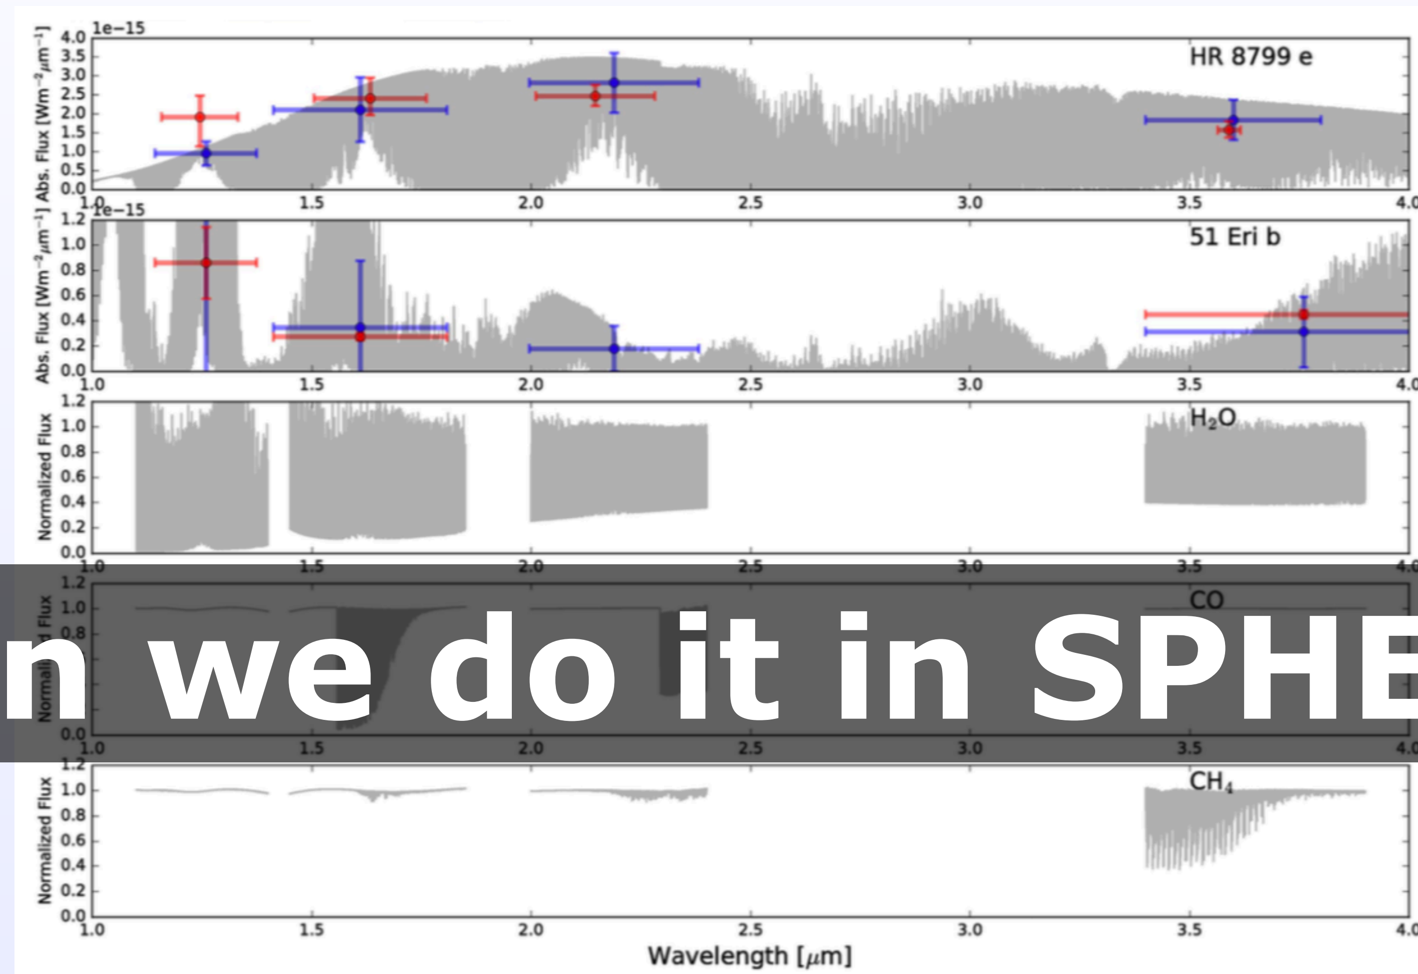
In-depth study by Wang et al. (2017)



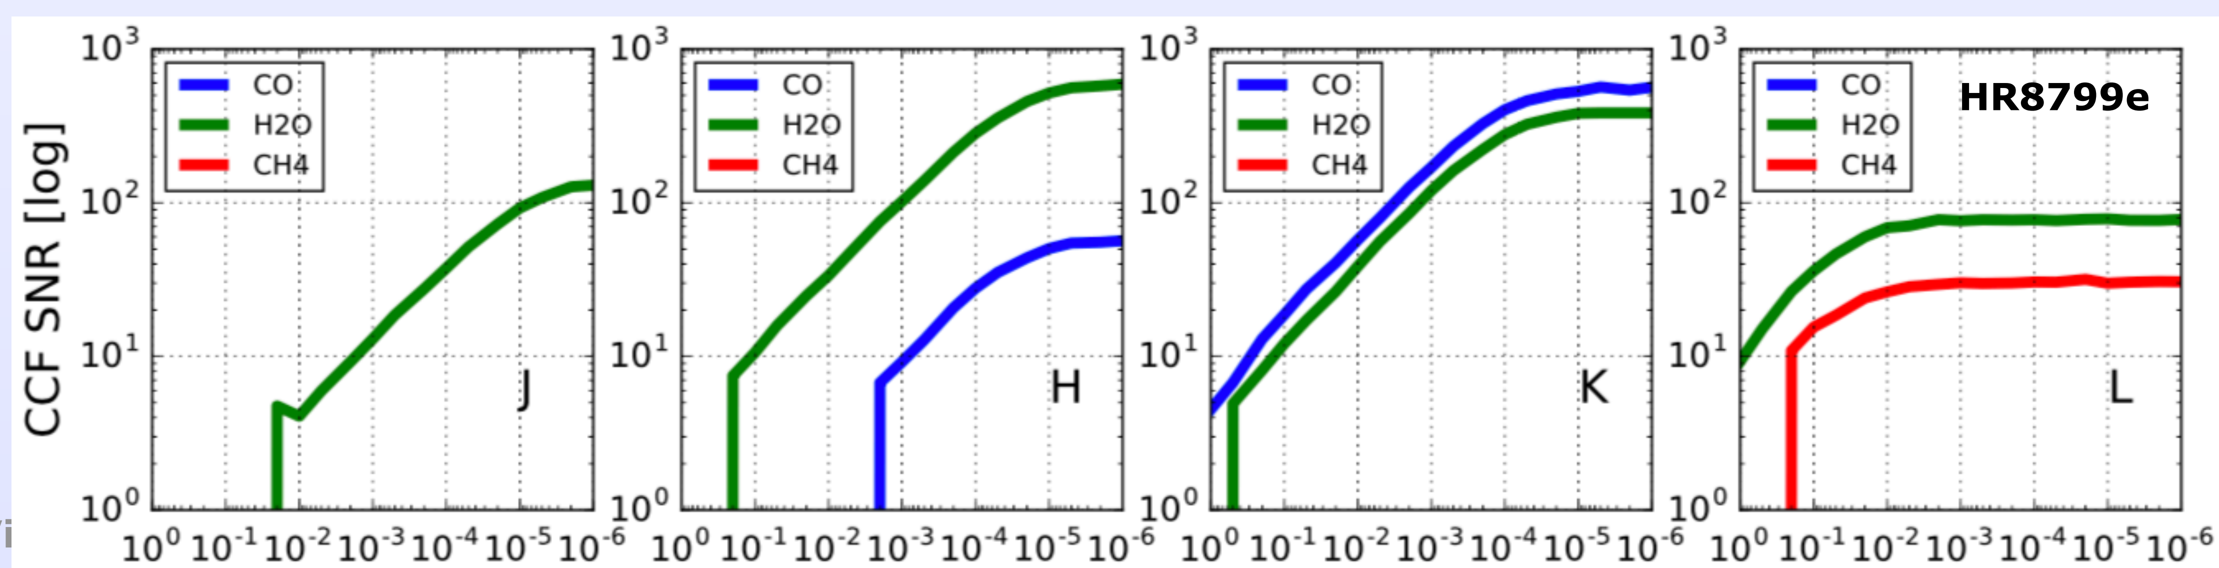


Combining HCI and HRS

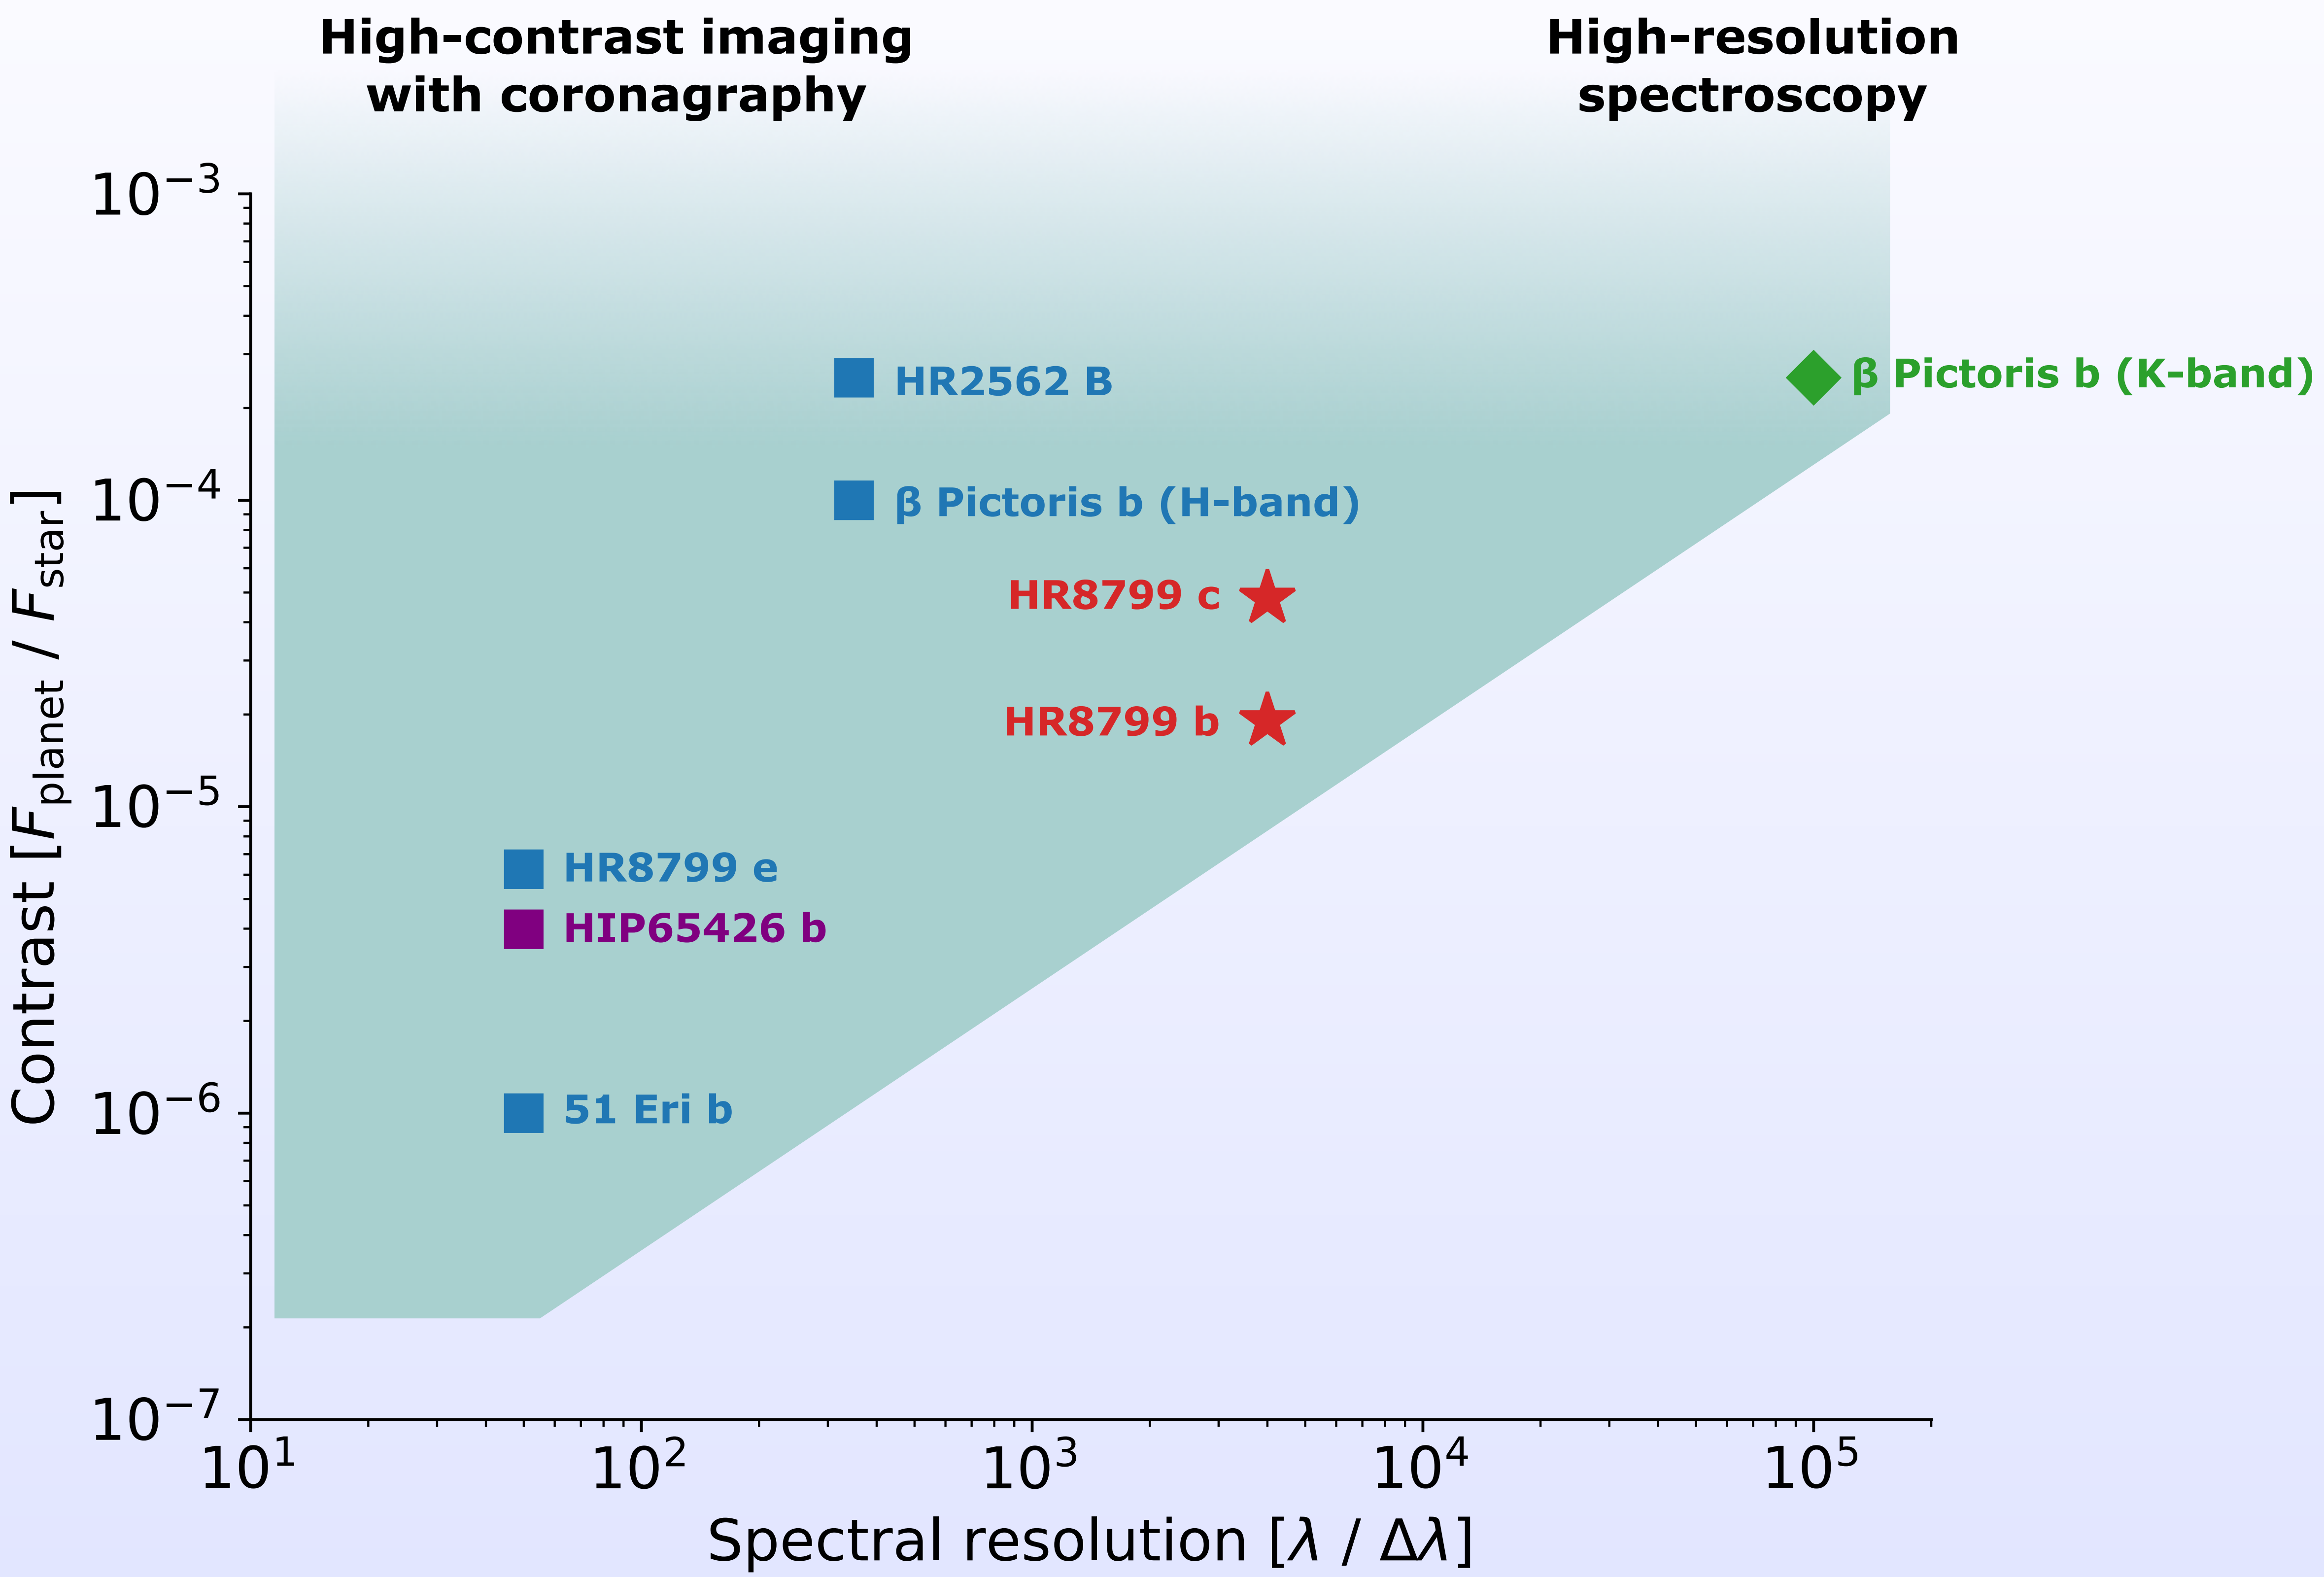
In-depth study by Wang et al. (2017)



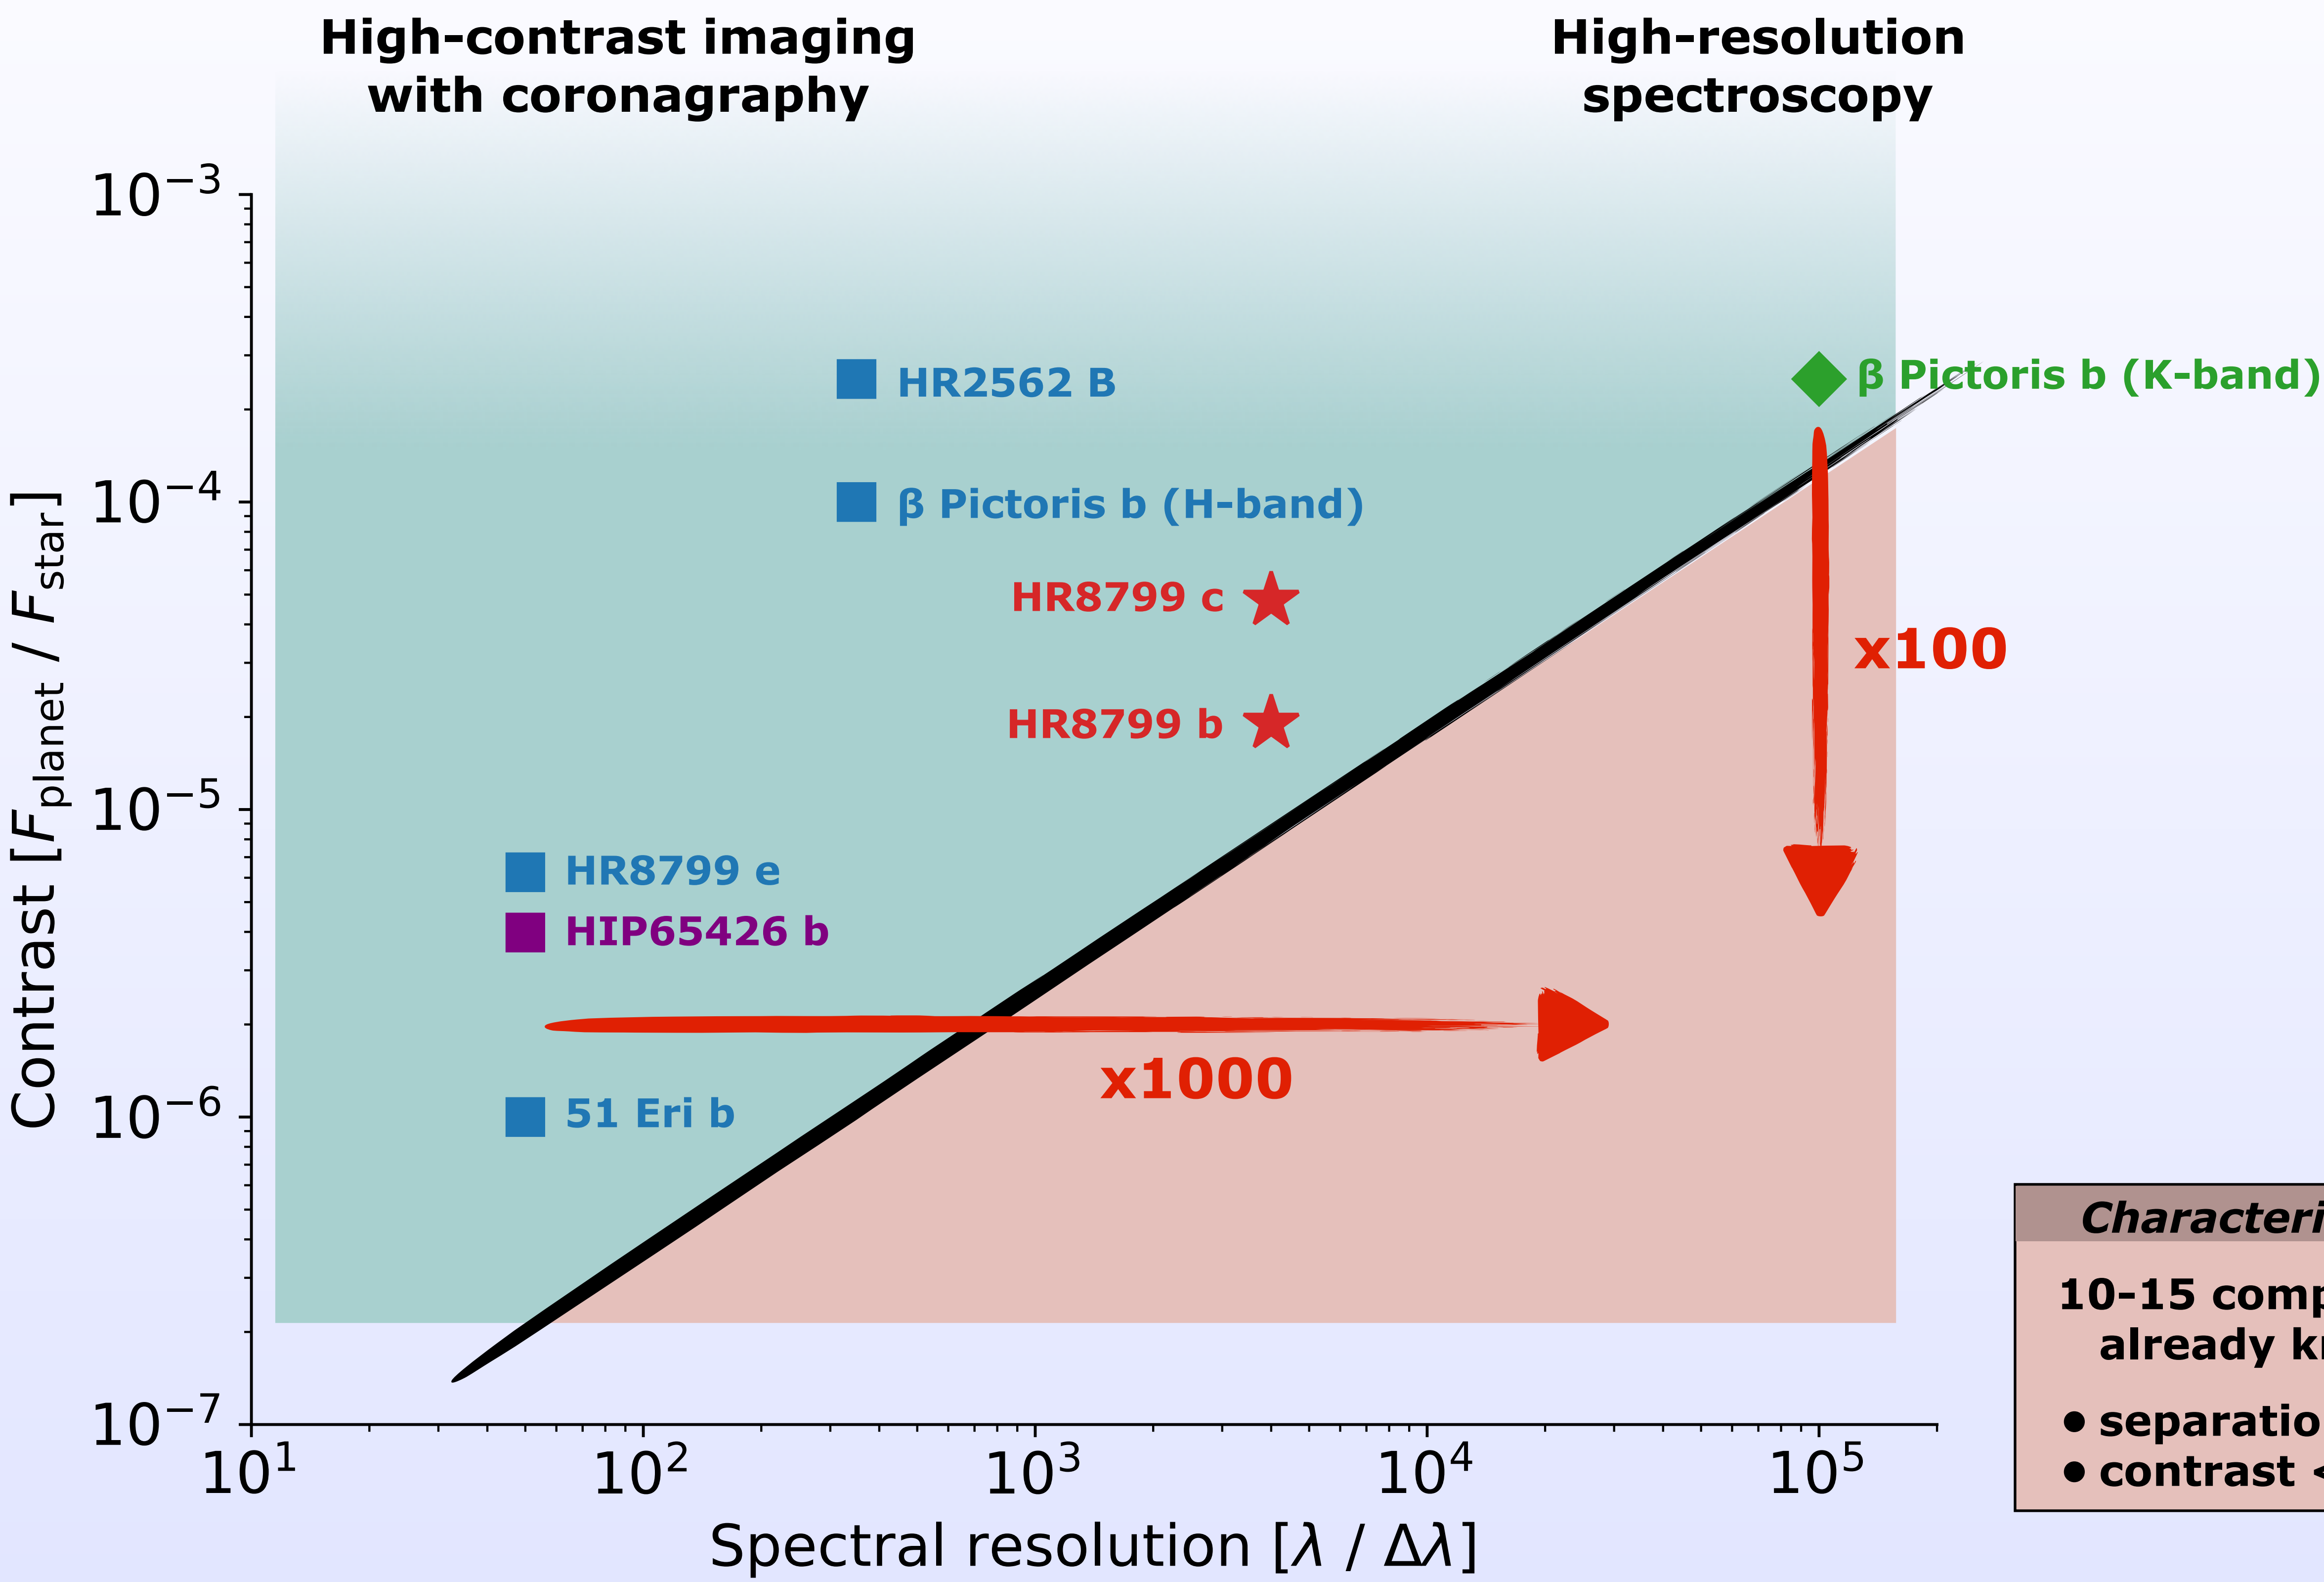
Can we do it in SPHERE?



Exoplanets at high-resolution



Exoplanets at high-resolution



Characterisation
10-15 companions already known
• separation < 1"   • contrast < 10^{-4}

HiRISE organisation

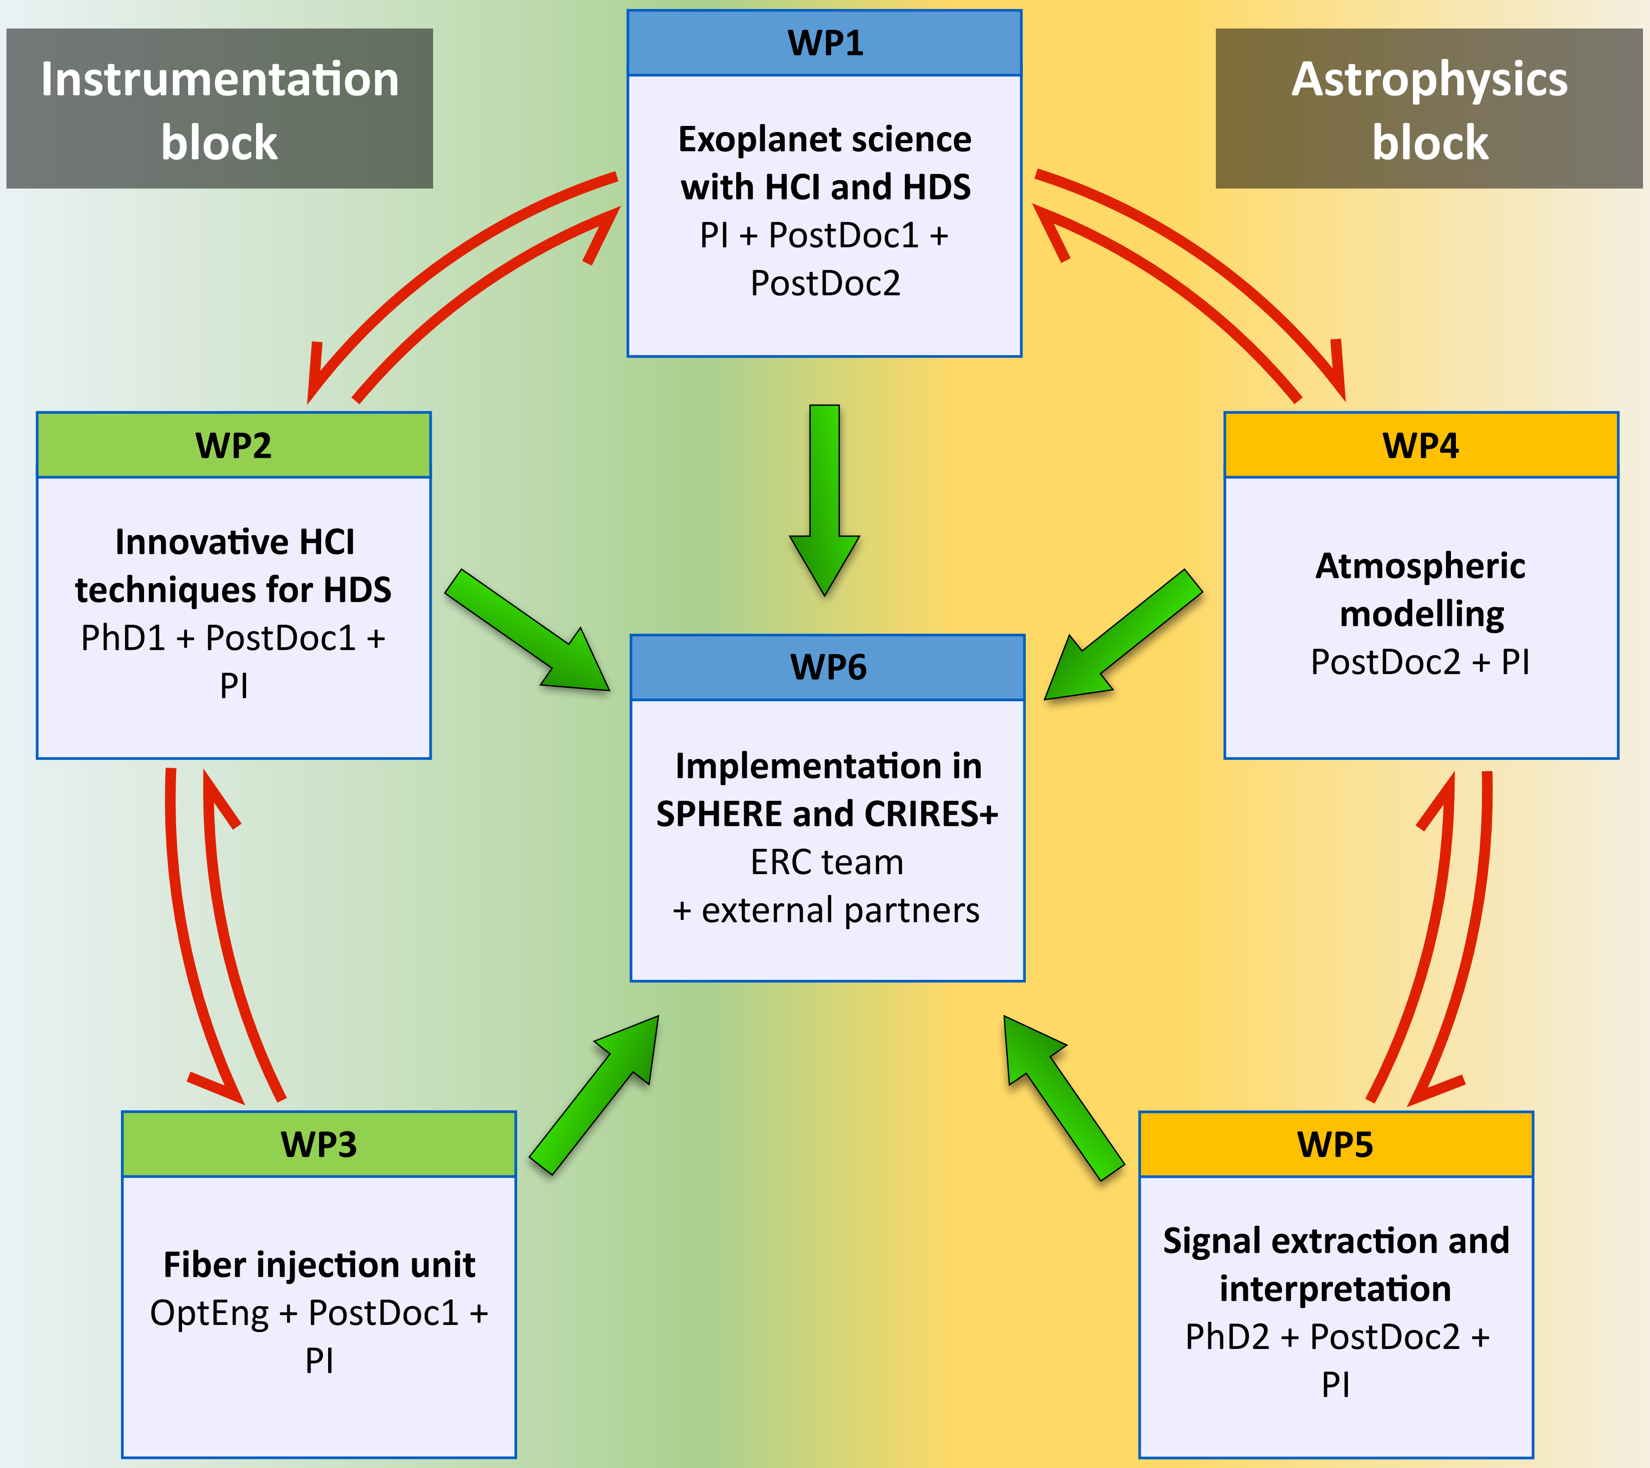
HiRISE

PI and coordinator
Arthur Vigan

Host institution
CNRS, Laboratoire d'Astrophysique de Marseille

1.5 M€ over 5 years, starting 2017-12
2 PhD students (3 yrs)
2 postdocs (3 yrs)
1 engineer (3 yrs)
+ funding for (some) hardware

External partners:
SPHERE and CRIRES+ consortia,
European Southern Observatory



Technical challenges?

Many technical questions!

- Do we have enough photons coming from directly imaged exoplanets?
- How to position the fibre on the planet (or the planet on the fibre)?
- How to best inject the planetary signal in the fibre?
- How to optimise the coupling?
- Is wavefront control needed to optimise the injection?
- How stable do we need to be in tip-tilt?
- What type of fibre do we use?
- How to design a module that fits within SPHERE?
- How many fibres do we need? How many can fit at the entrance of CRIRES+?
- ...

Technical challenges?

Many technical questions!

- <u>**Do we have enough photons coming from directly imaged exoplanets?**</u>
- How to position the fibre on the planet (or the planet on the fibre)?
- How to best inject the planetary signal in the fibre?
- How to optimise the coupling?
- Is wavefront control needed to optimise the injection?
- How stable do we need to be in tip-tilt?

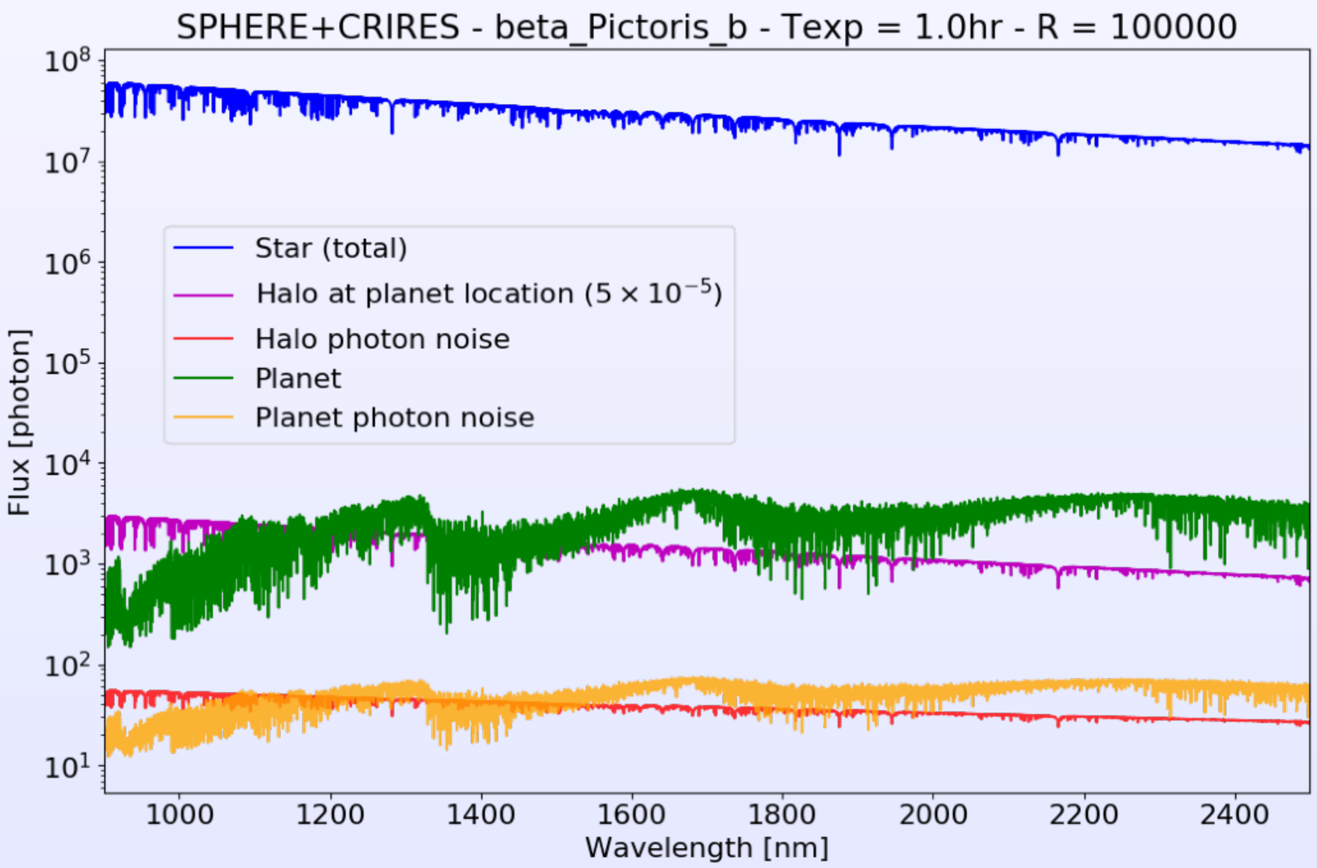
- How to design a module that fits within SPHERE?
- How many fibres do we need? How many can fit at the entrance of CRIRES+?
- ...

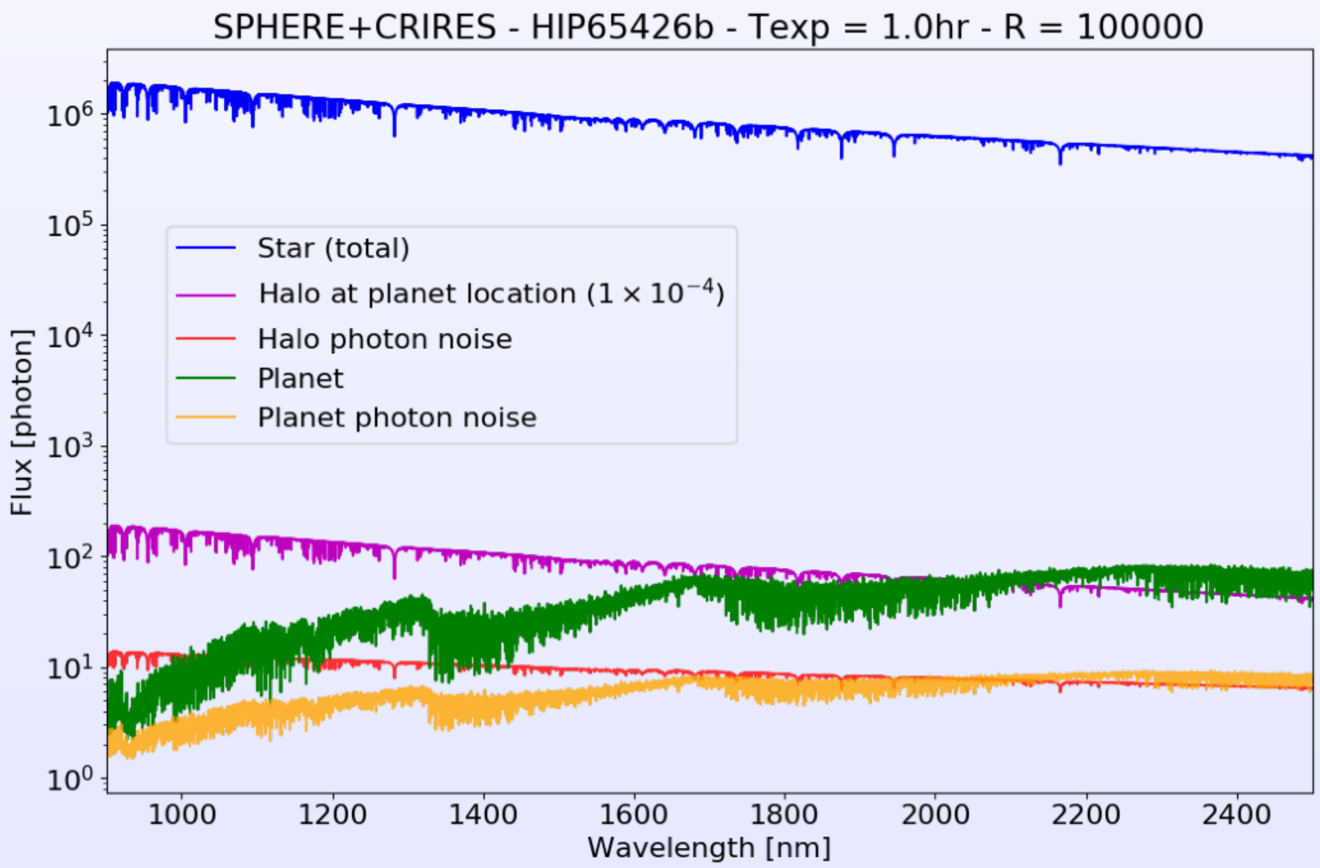
Preliminary simulations

- BT-NextGen model for the star
- BT-Settl model for the planet
- Magnitudes from the literature

- Texp = 1 hr
- $R=10^5$
- no spectral binning
- Realistic values for transmission

	Transmission
SPHERE	15 %
Injection	70 %
Fiber	99 %
CRIRES+	15 %





>1000 photon/channel
SNR > 100

>100 photon/channel
SNR > 10

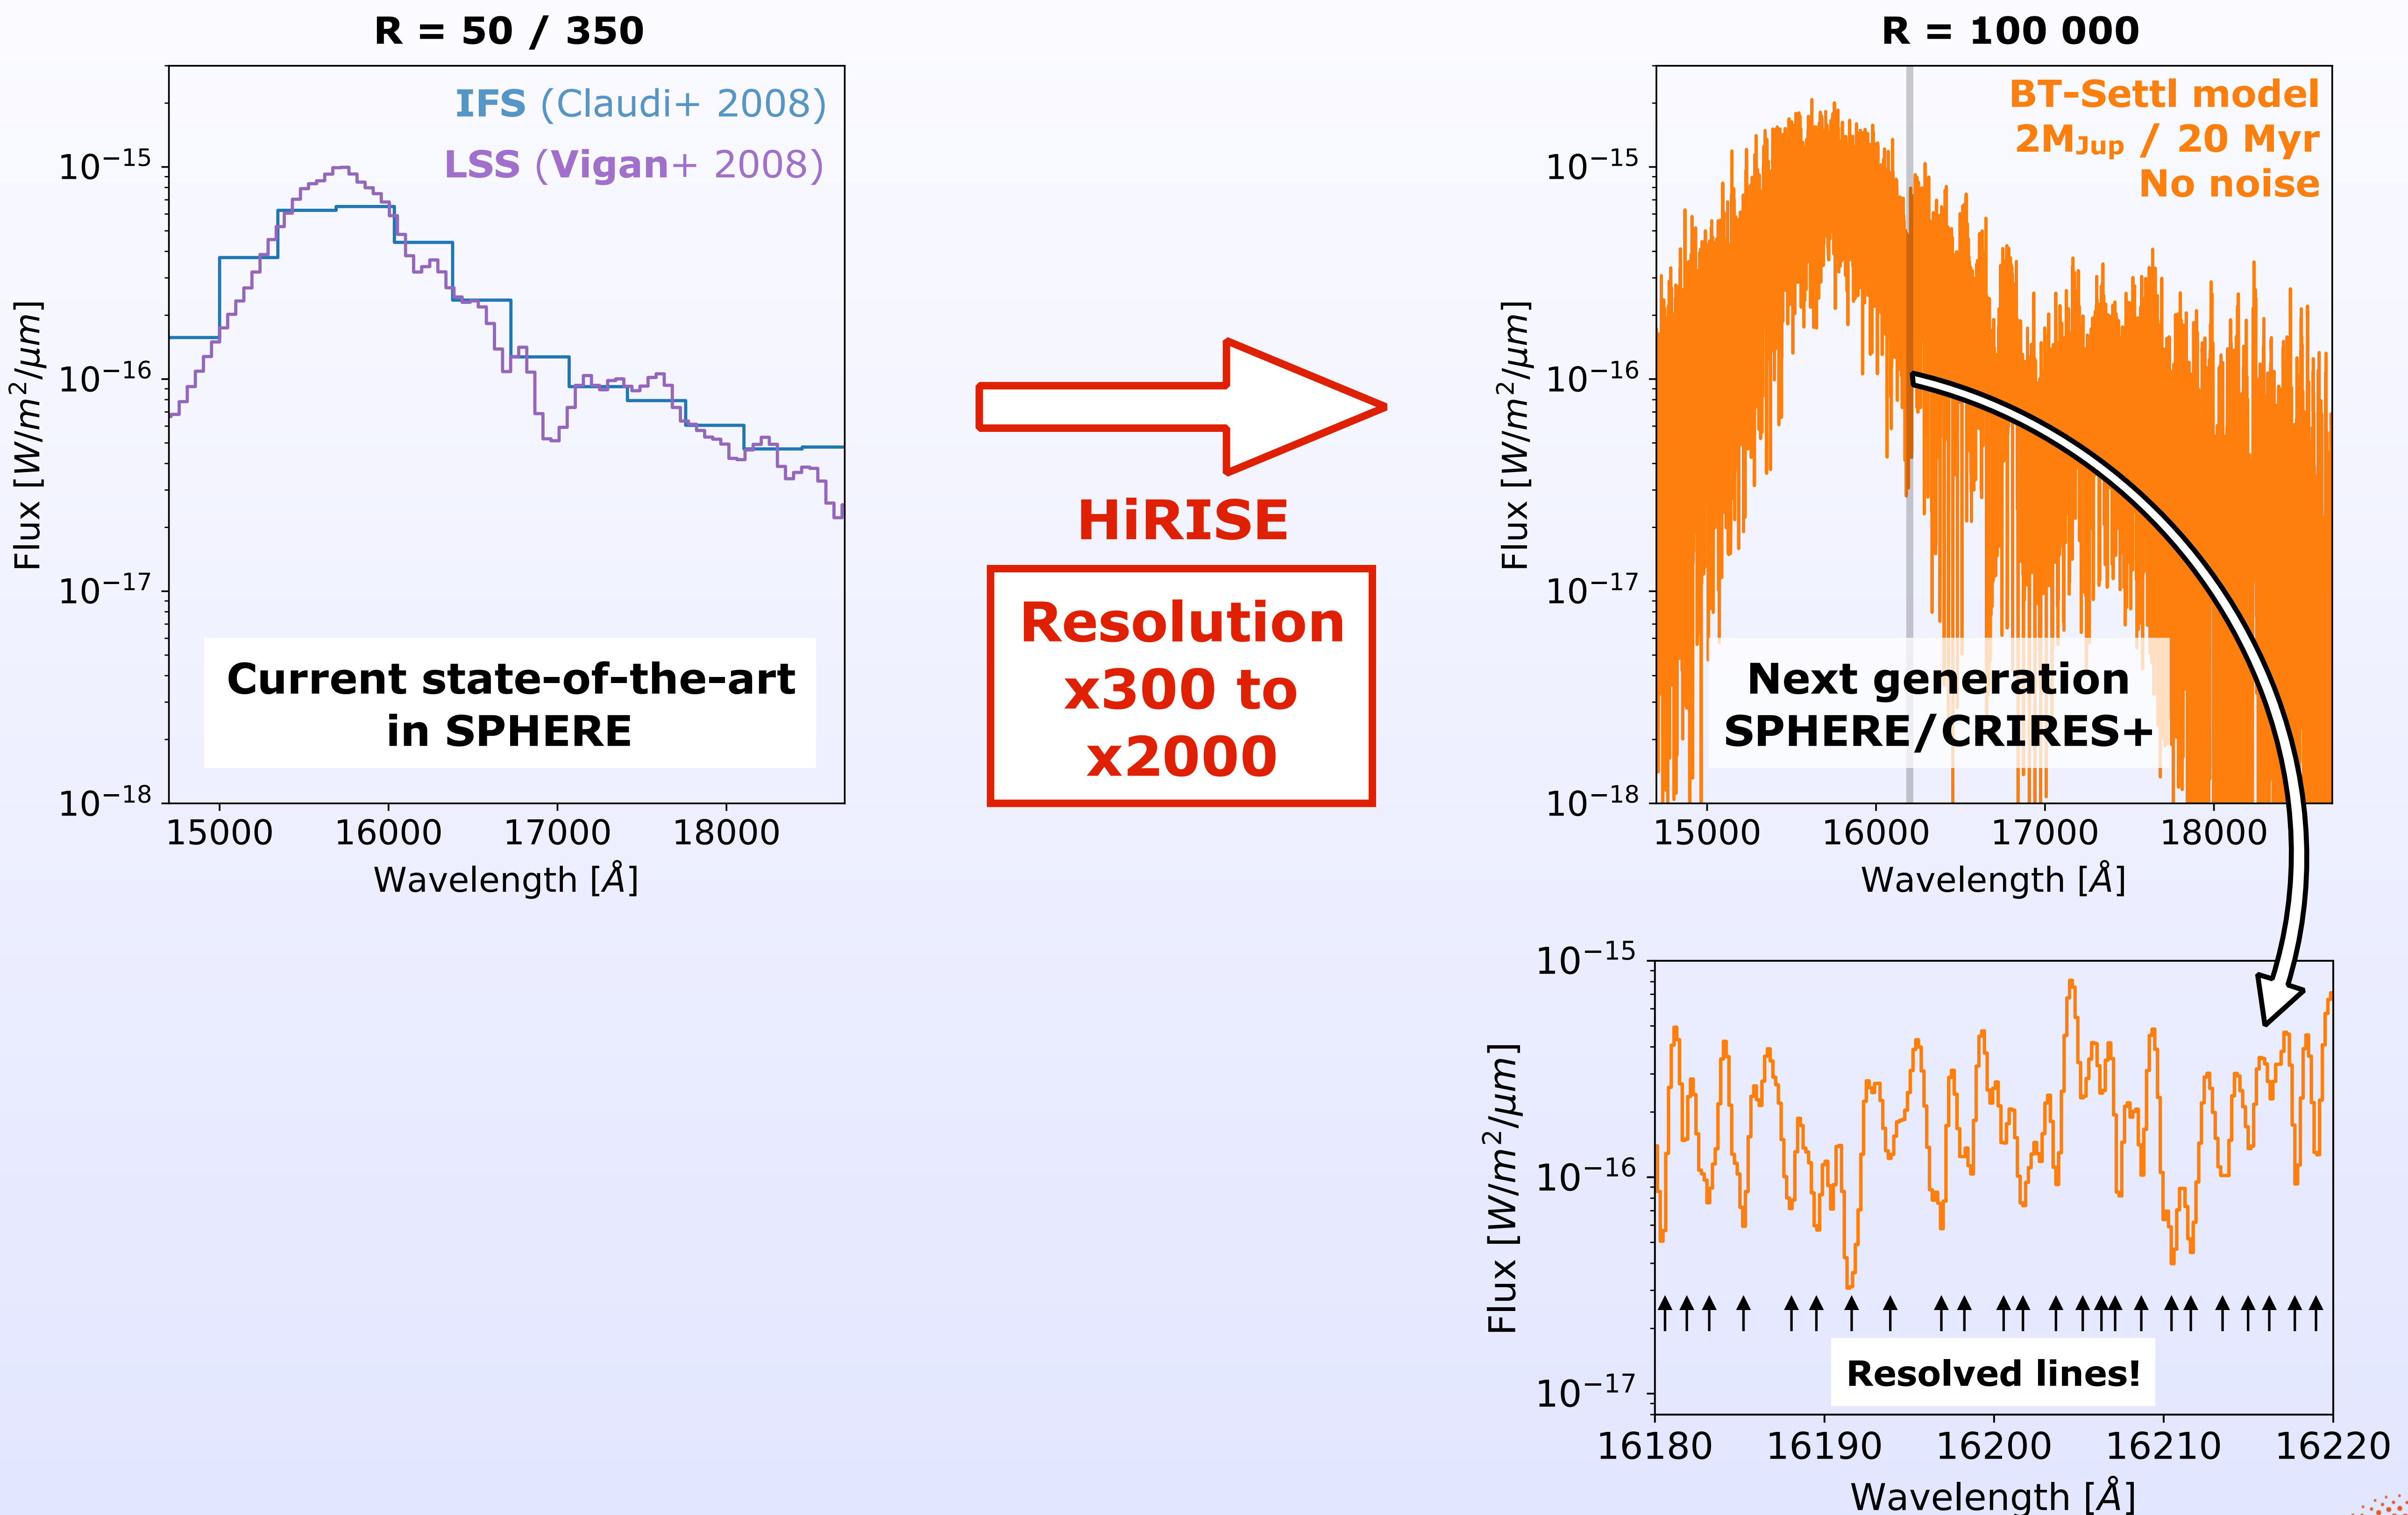
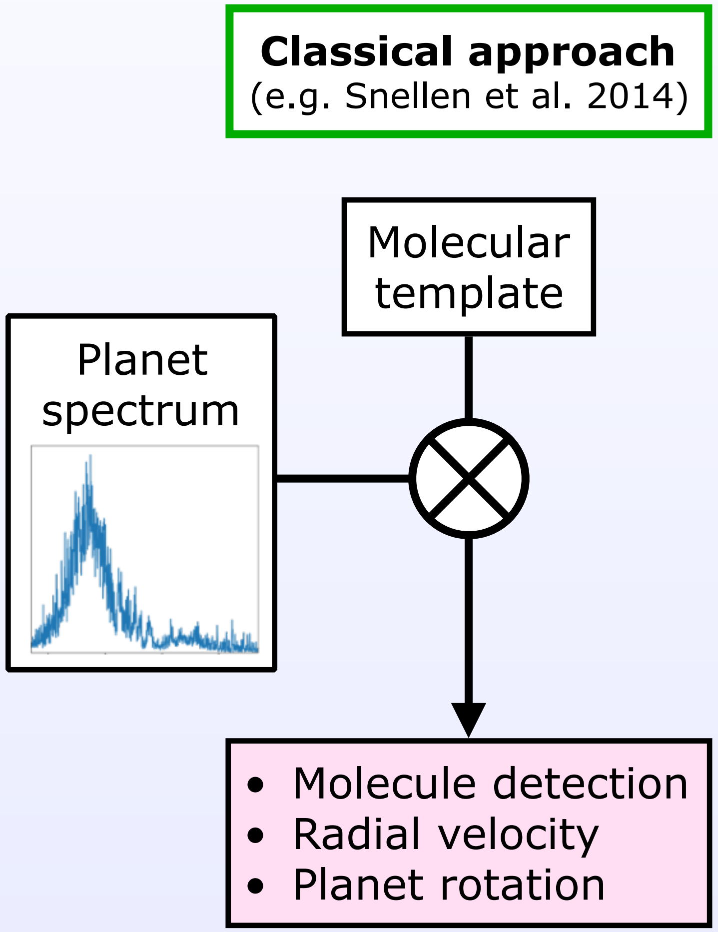
New science at high-spectral resolution



New science at high-spectral resolution

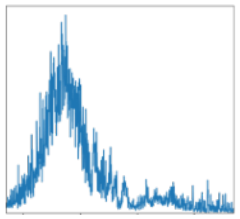


New science at high-spectral resolution

Classical approach
(e.g. Snellen et al. 2014)

Molecular template

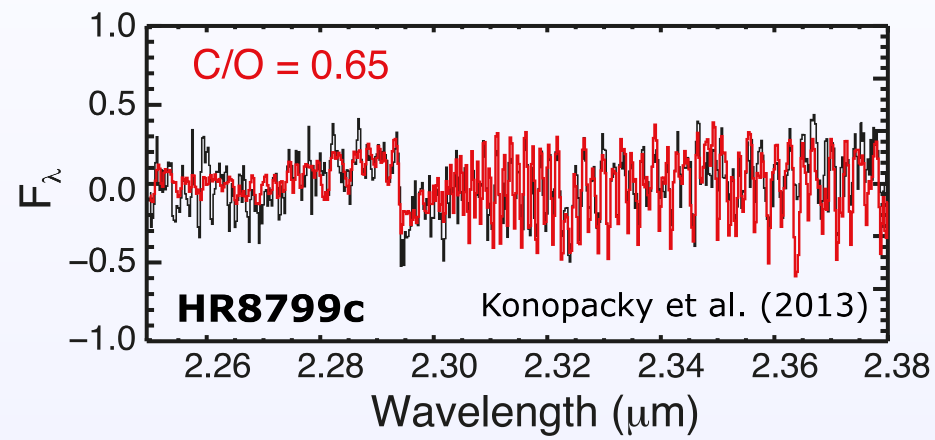
Planet spectrum



- Molecule detection
- Radial velocity
- Planet rotation

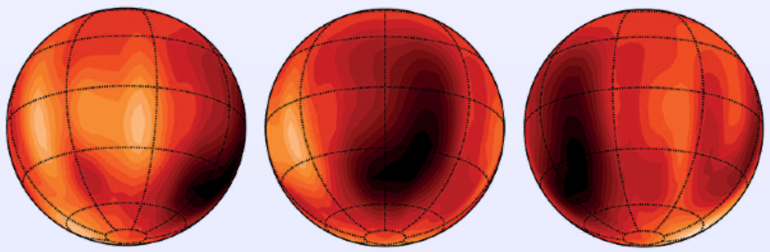
Molecular lines shape

Abundances determination



- formation scenario
- migration in the disk
- detailed composition

Time-resolved Doppler imaging



Luhman 16B (Crossfield et al. 2014)

- rotational period
- temporal variability
- cloud and winds

A brand new window on young giant exoplanets
Only feasible with high-spectral resolution

Prospects

- SPHERE/CRIRES+ implementation:
  - many technical challenges
  - brand new science within reach on young, giant exoplanets
- Long term:
  - ELT/HARMONI:
    - R=3000-20000
    - H- and K-band
  - ELT/PCS:
    - design studies will restart in coming years
    - HRS probably the only method to reach super-Earths
  - Space observations:
    - ~~WFIRST~~: low-resolution IFS (or no IFS)
    - LUVOIR: dedicated corono instrument
